Preface	xiii
Acknowledgments	xv
Authors	xvii
Chapter 1 Basic Concept of Smart Structure Systems	1
1.1 Introduction	1
1.1.1 Structures and Smart Structures	1
1.1.2 Significance of Smart Structure Technology for Civil Engineering Structures	2
1.2 Basic Principles of Smart Structure Technology for Seismic Response Control	3
1.3 History of Smart Structure Technology for Seismic-Response Control	6
1.4 Base-Isolation Systems	10
1.4.1 Introduction	10
1.4.2 Elastomeric Bearings	11
1.4.3 Lead-Plug Bearings	12
1.4.4 High-Damping Rubber Bearings	13
1.4.5 Friction Pendulum Bearings	14
1.4.6 Other Types of Base-Isolation Systems	15
1.5 Passive Energy-Dissipation Systems	16
1.5.1 Tuned Mass Dampers	17
1.5.2 Tuned Liquid Dampers	19
1.5.3 Friction Devices	20
1.5.4 Metallic Yield Devices	22
1.5.5 Viscoelastic Dampers	23
1.5.6 Viscous Fluid Dampers	24
1.6 Semiactive Damper Systems	26
1.6.1 Semiactive Tuned Mass Dampers	26
1.6.2 Semiactive Tuned Liquid Dampers	27
1.6.3 Semiactive Friction Dampers	28
1.6.4 Semiactive Vibration Absorbers	29
1.6.5 Semiactive Stiffness Control Devices	29

1.6.6	Electrorheological Dampers	31
1.6.7	Magnetorheological Dampers	32
1.6.8	Semiactive Viscous Fluid Damper	32
1.7	Active Control Systems	33
1.7.1	Basic Configuration of Active Control Systems	34
1.7.2	Active Mass Damper Systems	36
1.7.3	Active Tendon Systems	37
1.7.4	Active Brace Systems	38
1.7.5	Pulse Generation Systems	39
1.8	Hybrid Control Systems	40
1.8.1	Hybrid Mass Dampers	40
1.8.2	Hybrid Base-Isolation System	41
1.8.3	Hybrid Damper-Actuator Bracing Control	42
	References	45
Chapter 2	Base Isolation Systems	51
2.1	Basic Concepts of Seismically Isolated Building Structures	51
2.1.1	Single-Degree-of-Freedom Motion Equations	51
2.1.2	Multiple-Degree-of-Freedom Motion Equations	54
2.2	Base Isolator Mechanical Characteristics and Computer Modeling Techniques	64
2.2.1	Introduction	64
2.2.2	Bilinear Model and Model Parameters	65
2.2.3	Bilinear Model of Lead-Plug Bearing System	67
2.2.4	Bilinear Model of High Damping Rubber System	68
2.2.5	Bilinear Model of Friction Pendulum System	69
2.2.6	Computer Modeling of Isolation System	70
2.3	Code Requirements for Design of Seismically Isolated Structures	72
2.3.1	Introduction	72
2.3.2	Seismic Ground Motion	73
2.3.3	Analysis Procedure Selection	76
2.3.4	Equivalent Lateral Force Procedure	78
2.3.5	Dynamic Analysis Procedure	85
2.4	Design Examples	90
2.5	Testing Verification and Determination of Isolator Properties	103
2.5.1	Testing Requirements of ASCE 7-05	103
2.5.2	Modifications of Isolator Properties	105
	References	106
Chapter 3	Damping Systems	109
3.1	Basic Concepts of Building Structures with Damping System	109
3.1.1	Single-Degree-of-Freedom Motion Equations	109
3.1.2	Multiple-Degree-of-Freedom Motion Equations	115
3.2	Analysis Procedures and Code Requirements	118

3.2.1	Introduction	118
3.2.2	Response Spectrum Analysis	120
3.2.3	Equivalent Lateral Force Analysis	133
3.2.4	Nonlinear Static Procedure	138
3.2.5	Special Requirements on Nonlinear Response History Procedure	141
3.3	Design Examples	141
3.4	Testing Verification and Determination of Damping Device Properties	154
3.4.1	Introduction	154
3.4.2	Prototype Test Procedures	155
3.4.3	Acceptance Criteria for Velocity-Dependant Damping Devices	156
3.4.4	Acceptance Criteria for Displacement-Dependant Damping Devices	156
	References	157
Chapter 4	Smart Seismic Structures Using Active Control Systems	159
4.1	Analytical Model of Smart Seismic Structures with Active Control	159
4.1.1	Motion Equations of Smart Seismic Structures with Active Tendon Control	160
4.1.2	Motion Equations of Smart Seismic Structures with Active Mass Damper	164
4.1.3	State-Variable Representation of Smart Seismic Structures	167
4.1.4	Feedback Law and Implementation Schemes	168
4.1.5	Solution Procedure for State Equation	174
4.2	Classical Optimal Control Algorithms for Smart Seismic Structures	182
4.2.1	Riccati Optimal Active Control Algorithm	183
4.2.2	Pole Placement Algorithm	201
4.3	Development of Active Control Algorithms for Seismic Smart Structures	205
4.3.1	Instantaneous Optimal Active Closed-Loop Control Algorithm	206
4.3.2	Generalized Optimal Active Control Algorithm	208
4.3.3	GOAC Algorithm for Nonlinear Smart Seismic Structures	223
4.4	Concluding Remarks	233
	References	233
Chapter 5	Smart Seismic Structures Using Semiactive and Hybrid Control Systems	237

5.1	Dynamic Model of Control Devices for Semiactive and Hybrid Systems	238
5.1.1	Modeling of Servovalve-Controlled Hydraulic Actuators	238
5.1.2	Modeling of Passive Dampers	246
5.1.3	Modeling of Semiactive Dampers	252
5.2	Dynamic Model of Smart Seismic Structures with Semiactive or Hybrid Control	257
5.2.1	System Description	258
5.2.2	Shear Building Structures with Hybrid Devices on All Floors	259
5.2.3	Structures with Control Devices on Some Floors	263
5.2.4	Verification of the General Model for HDABC-Controlled Structures	266
5.2.5	State-Variable Representation of the HDABC System ...	271
5.2.6	Summary	279
5.3	Control Strategy and System Stability	280
5.3.1	Control Algorithms	280
5.3.2	Intelligent Hybrid Control Systems	281
5.3.3	Stabilization of Servovalve-Controlled Hydraulic Actuators	283
5.3.4	Effect of Actuator Dynamics on System Response	292
5.3.5	Summary	295
5.4	Effectiveness of HDABC System for Seismic Response Control	296
5.4.1	One-Story Smart Seismic Structure with HDABC System	296
5.4.2	Three-Story Smart Seismic Structure with HDABC System	302
5.4.3	Effectiveness Comparison of HDABC System and MR Damper	304
5.4.4	Summary	307
5.5	Implementation of Hybrid Control for Smart Seismic Structures	310
5.5.1	Test Setup	310
5.5.2	Parameter Identification of Control Devices	311
	References	312

Chapter 6	Sensing and Data Acquisition Systems for Smart Seismic Structures	315
6.1	Common Sensors for Smart Seismic Structures	316
6.1.1	Linear or Rotary Variable Differential Transducer	318
6.1.2	Velocity Sensors	319
6.1.3	Accelerometers	320
6.1.4	Strain Gauges	324

6.1.5	Force Transducers	326
6.2	Sensing, Data Acquisition, and Digital Control Systems	328
6.2.1	Elements of Data Acquisition and Digital Control Systems	329
6.2.2	Challenges in Sensing System of Smart Structures	332
6.2.3	Solutions for the Sensing System of Smart Seismic Structures	333
6.3	Seismic Observer Technique	336
6.3.1	Analytical Modeling of Smart Seismic Structures with Accelerometers	336
6.3.2	Conventional Observer Technique	338
6.3.3	Development of Observer Technique for Smart Seismic Structures	342
6.3.4	Simplified Sensing System for Smart Seismic Structures	347
6.3.5	Summary	355
	References	356
Chapter 7	Optimal Device Placement for Smart Seismic Structures	359
7.1	Introduction	359
7.1.1	Basic Concepts of Engineering Optimization	359
7.1.2	Significance of Optimal Device Placement for Smart Seismic Structures	361
7.1.3	Review of Former Studies on Optimal Device Placement	361
7.2	Optimal Actuator Placement for Smart Seismic Structures with Active Control	365
7.2.1	Measure of Modal Controllability	366
7.2.2	Performance Index	370
7.2.3	Controllability Index	375
7.2.4	Discussions on Performance Indices	394
7.3	Statistical Method for Optimal Device Placement of Smart Seismic Structures	394
7.3.1	System Description	395
7.3.2	Review of Stochastic Theory of Structural Seismic Response	397
7.3.3	Modal Analysis of Smart Structures with Hybrid System	398
7.3.4	Stochastic Seismic Response of Hybrid-Controlled Smart Structures	400
7.3.5	Determination of Optimal Placement of Control Devices	411
7.3.6	Numerical Studies	421
7.4	Summary	427
	References	428

Chapter 8	Active Control on Embedded Foundation	431
8.1	Motion Equation of Actively Controlled Structure with Soil–Structure Interaction.....	431
8.1.1	System Definition	431
8.1.2	Single-Story Building.....	433
8.1.3	Multiple-Story Building	436
8.1.4	Determination of Interaction Force at Foundation-Soil Interface	440
8.2	State Equation of SSI—Model and Solution Technique	443
8.2.1	Formulation of State Equation of SSI-Model.....	443
8.2.2	Solution Technique.....	445
8.3	Generalized Optimal Active Control Algorithm for the SSI System	448
8.3.1	System Model	448
8.3.2	Generalized Performance Index	448
8.3.3	Feedback Gain Matrix and Active Control Force	450
8.3.4	Weighting Matrix Configuration	452
8.4	Soil Properties and Wave Equations	455
8.4.1	Dynamic-Equilibrium Equation	455
8.4.2	Earthquake Propagation Waves	460
8.5	Stiffness Coefficients of Horizontal Layer and Half Plane	469
8.5.1	Dynamic-Stiffness Coefficients of Horizontal Layer.....	469
8.5.2	Dynamic-Stiffness Coefficients of Half Plane	476
8.6	Dynamic-Stiffness Matrices of Ground System	480
8.6.1	Definition and Concept	480
8.6.2	Free-Field System's Stiffness Matrix	481
8.6.3	Excavated Part's Stiffness Matrix in Frequency Domain	487
8.6.4	Ground System's Stiffness and Flexibility Matrix	492
8.7	Numerical Illustrations.....	499
8.7.1	Solution Procedure of SSI System without Control	499
8.7.2	Solution Procedure of SSI System with Control	510
8.8	Computer Solutions for Building Structures with and without Control.....	516
8.9	Summary and Concluding Remarks.....	519
	References	521
Chapter 9	Hybrid Control of Structures on Shallow Foundation with Existing and Generated Earthquakes	523
9.1	Introduction.....	523
9.1.1	Interaction Types	523
9.1.2	Substructure Approach.....	524
9.2	Structural Formulation with HDABC	526

9.2.1	Hybrid Controlled Single-Story Structure without SSI	526
9.2.2	Hybrid Controlled Single-Story Building with SSI	528
9.2.3	Hybrid Controlled Multiple-Story Building without SSI	532
9.2.4	Hybrid Controlled Multiple-Story Building with SSI	534
9.3	State Space Formulation of HDABC Systems with and without SSI	540
9.3.1	Single-Story Structural System without SSI	540
9.3.2	Single-Story Structural System with SSI	541
9.3.3	Multiple-Story Building System without SSI	542
9.3.4	Multiple-Story Structural System with SSI	543
9.4	Numerical Examples Using MATLAB®	544
9.4.1	Fixed Support without Control	545
9.4.2	SSI without Control	548
9.4.3	Fixed Support with Passive Control	552
9.4.4	SSI with Passive Control	554
9.4.5	Fixed Support with Active Control	556
9.4.6	Fixed Support with Hybrid Control	558
9.4.7	SSI with Hybrid Control	560
9.5	Extreme Value Distribution	563
9.5.1	Extreme Value and Description	564
9.5.2	Gumbel-Type Distribution	564
9.6	Ground Motion Generation	569
9.6.1	Modeling Concept	569
9.6.2	Ground Motion Generated at Bed Rock Surface	569
9.6.3	Ground Motion Generated at Ground Surface	572
9.6.4	One-Hundred Ground Motions Generated at $m_j = 6.0$	572
9.7	Case Studies Using Generated Earthquakes	573
9.7.1	Numerical Examples of Fixed Supported Buildings with and without Controls	573
9.7.2	Numerical Examples of Buildings with SSI and Hybrid Control	581
9.8	Concluding Remarks	581
	References	582
Appendix A: MATLAB®		585
A.1	MATLAB® Language	585
A.2	Common Functions Used for Analysis and Design of Smart Seismic Structures	588
A.3	Sample MATLAB® .M Program	592
	References	595

Appendix B: Green's Function	597
B.1 Displacements in k -Domain for Loads on Vertical Line	597
B.1.1 Fixed Layer (Part I)	597
B.1.2 Free Layer (Part II)	605
B.1.3 Global Displacements	607
B.2 Displacements in k -Domain for Loads on Horizontal Line	608
B.3 Displacement for Vertical Incident Wave	611
B.3.1 Loads on Vertical Line	611
B.3.2 Loads on Horizontal Line	617
B.4 Green's Influence Functions in Space Domain	618
Appendix C: Element Stiffness and Mass Coefficients	621
C.1 Element Stiffness Coefficients	621
C.2 Element Mass Coefficients	625
Notation	627
Index	643
