Preface	xi
Chapter 1	
Introduction	1
1 Boundary collocation versus other modelling methods	1
2 Different names of presented formulation.....	4
3 Short review of present monograph	5
Chapter 2	
General information	15
1 Description of the method – basic versions of boundary collocation.....	15
2 Relation between boundary collocation, boundary integral Trefftz approach and regular boundary element method	18
3 Conditioning of the Trefftz-type formulations	22
Chapter 3	
Analytical trial T-functions applied in the boundary collocation method.....	29
1 Complete systems of general solutions	29
2 Influence functions with singularities outside an investigated region	34
3 Influence T-functions represented by trigonometric series	37
4 Heuristic T-functions.....	38
5 Special purpose T-functions.....	39
Chapter 4	
Substructuring and T-elements	51
Chapter 5	
Basic numerical investigations of the boundary collocation method	63
1 Simply connected regions	63
2 Doubly connected regions.....	87

Chapter 6

2D harmonic problems – the Laplace-type equations 95

- 1 Torsion of prismatic bars. Formulation of the boundary value problem..... 95
- 2 Application of the boundary collocation method to twisted bars – review 96
- 3 Torsion of a bar made of different materials 97
- 4 The Poiseuille flow..... 101
 - 4.1 Formulation of the problem..... 101
 - 4.2 Optimal filling of a cylindrical pipe in gravitational laminar liquid flow 104
- 5 Singular membrane problem 110
- 6 The Laplace-type solutions with special T-complete functions 116
 - 6.1 Area with K symmetry axes 116
 - 6.2 Region with a corner 118
 - 6.3 Composite regions with cylindrical rods..... 120
- 7 Recent observations..... 125

Chapter 7

Problems described by two-dimensional, biharmonic equations..... 135

- 1 Typical problems..... 135
- 2 Plane creeping flow. Boundary collocation as a modification of the Trefftz method..... 135
- 3 Special purpose trial functions for 2D creeping flow 140
 - 3.1 Bi-symmetrical axis flow in a cylinder 140
 - 3.2 Symmetrical flow in vicinity of cylinder..... 144
 - 3.3 Flow in vicinity of rotating cylinder..... 146
 - 3.4 Flow around a stiff corner 149
 - 3.5 Stick-slip problem 153
 - 3.6 Flow in vicinity of a rectangular corner, one wall of which moves at constant velocity..... 156
- 4 Thin plate bending..... 157
 - 4.1 Boundary problem formulation 157
 - 4.2 Construction of special purpose trial functions 158
 - 4.3 Application of the special purpose trial functions. Example 163

Chapter 8

Two-dimensional problem of elastostatics..... 175

- 1 Formulation of the 2D elastic problem..... 175
- 2 Example: tension of square plate with a central hole 177
- 3 Application of the T-complete Herrera and Kupradze functions 180
- 4 Optimization of helical spring cross-section 185
 - 4.1 T-complete system 185
 - 4.2 Preliminary numerical investigations 187
 - 4.3 Optimization procedure of helical spring cross-section 188

Chapter 9

Inverse problems in 2D elasticity	201
1 Introduction.....	201
2 The Trefftz formulation of the boundary value problem.....	201
3 Three methods of solving inverse problems.....	204
3.1 Optimization of unknown boundary conditions with respect to measurement functional (method 1).....	204
3.2 Direct comparison of calculated and measured stresses (method 2).....	204
3.3 Extrapolation of inside solution (method 3).....	204
4 Numerical illustration.....	205
4.1 First example.....	206
4.2 Second example	209
4.3 Third example	214
5 Conclusions	219

Chapter 10

Three-dimensional problem described by elliptic equations	223
1 General information	223
2 3D potential problems	223
3 3D creeping flow.....	225
4 Spatial (3D) elastostatic problems.....	226
5 Other applications of boundary collocation method to 3D problems.....	229

Chapter 11

Non-homogenous equations and nonlinear boundary conditions.....	243
1 Non-homogenous harmonic problems	243
1.1 Integral form solution.....	243
1.2 Solutions with radial basis functions.....	246
2 Non-homogenous biharmonic problems	250
3 Boundary collocation method applied to non-linear conditions.....	252
3.1 Non-linear boundary conditions.....	252
3.2 Unknown position of source points or collocation points	253
3.3 Steady problem with variable boundary.....	254
3.4 Surface wave problems	254

Chapter 12

Physically non-linear, elastic-plastic problems.....	259
1 Scheme of solution.....	259
2 Numerical illustration of the algorithm proposed.....	263
3 Final remarks.....	280

Chapter 13

Problems described by parabolic equations	283
--	------------

1	The boundary collocation method in boundary–initial problems.....	283
1.1	Introduction	283
1.2	The Ojalvo–Linzer method	284
1.3	Method based on the Laplace transformation.....	286
1.4	The boundary collocation method with use of time discretization...	287
1.5	Method based on fundamental solutions of heat transfer equation	287
2	The boundary collocation for non-stationary temperature field; comparison with the FEM.....	288
2.1	Formulation of the example	288
2.2	The BCM with Laplace’s transformation (BCL)	289
2.3	The BCM with fundamental solutions as trial functions (BCF).....	293

Chapter 14

Eigenvalue problems 301

1	Problem formulation and general description of the method	301
2	Example. Determination of eigenvalues for a silencer.....	302

Chapter 15

Final remarks, conclusions and perspectives 311

Index 313
