

TABLE OF CONTENTS

Preface	7
Chapter 1. General information on materials testing at different rates	9
1.1. Introductory remarks	9
1.2. Fundamental information on dynamic tests – strain rate spectrum in tension, compression and shear	10
1.3. Fundamental information on tests in fracture dynamics – loading rate spectrum	20
1.4. Overview approach to experiment and modeling in fracture dynamics	23
1.5. Overview approach to dynamic plasticity – experiment and modeling	26
1.6. How to determine rate and temperature effects	28
1.7. Definitions of rate sensitivities	30
1.8. Remarks on temperature effects in elasticity	35
1.9. Remarks on temperature effects in plasticity	41
1.10. Remarks on strain hardening – parabolic approximation	47
1.11. Strain hardening by differential approximation	60
1.12. Strain rate and temperature effects by differential approximation	62
1.13. Rate effects in loss of stability in tension test – BCC metals	70
References	81
Chapter 2. Elementary wave mechanics	86
2.1. Kinematics of material points and rigid bodies	86
2.2. Principles in dynamics of material points	90
2.3. Impact of solids	102

2.4.	Elastic waves in slender rods	112
2.5.	Waves in finite slender bars	134
2.6.	Advanced approach to elastic waves in bars	153
2.7.	Remarks on plastic waves in bars	170
	References	183
 Chapter 3. Some experimental techniques for materials		
	testing at high strain rates	186
3.1.	Tests at high strain rates	186
3.2.	The Davies – Hopkinson bar	188
3.3.	The split Hopkinson pressure bar (SHPB) – Kolsky bar	192
3.4.	Modern versions of split Hopkinson pressure bar (SHPB)	197
3.5.	Behavior of cylindrical specimen in compression	215
3.6.	Direct impact compression test	237
3.7.	Tension tests at high strain rates	257
3.8.	Materials testing in torsion and shearing	293
3.9.	Materials testing with long specimens	316
3.10.	Concluding remarks	329
	References	332
