<i>Preface to the second edition</i>	ix	2.9 Torsion of a thin circular tube	57
<i>Preface to the first edition</i>	ix	2.10 Joints	58
<i>Notation</i>	x	Summary	59
	x	Problems	60
	xii		
1 Statically Determinate Force Systems	3 Stress–Strain Relations	64	
1.1 Revision of statics	3.1 Deformation	64	
1.2 Resultant force and moment	3.2 Strain	64	
1.3 Types of structural and solid-body components	3.3 Elastic load–deformation behaviour of materials	67	
1.4 Types of support and connection for structural components	3.4 Elastic stress–strain behaviour of materials	67	
1.5 Statical determinacy	3.5 Lateral strain and Poisson's ratio	70	
1.6 Free-body diagrams	3.6 Thermal strain	70	
1.7 Determinacy criteria for structures	3.7 General stress–strain relationships	71	
1.8 Determination of axial forces by equilibrium statements	3.8 Strains in a statically determinate problem	74	
1.9 Forces by the method of tension coefficients	3.9 Elastic strain energy	75	
1.10 Bending of slender members	3.10 Strain energy from normal stress	75	
1.11 Force and moment equilibrium during bending	3.11 Strain energy from shear stress	76	
1.12 Sign convention for bending	3.12 Plastic stress–strain behaviour of materials	77	
1.13 Shear-force and bending-moment diagrams	3.13 Viscoelastic stress–strain behaviour of materials	78	
1.14 Cantilever carrying a concentrated load	Summary	79	
1.15 Cantilever carrying a uniformly distributed load	Problems	79	
1.16 Simply supported beam carrying a uniformly distributed load			
1.17 Point of contraflexure	4 Statically Indeterminate Stress Systems	82	
1.18 Torsion of members	4.1 Interaction between components of different stiffness	82	
1.19 Members subjected to axial force, bending moment and torque	4.2 Restraint of thermal strain	88	
1.20 Torque diagram	4.3 Volume changes	91	
1.21 The principle of superposition	4.4 Constrained material	93	
Summary	4.5 Maximum stress due to a suddenly applied load	94	
Problems	4.6 Maximum stress due to impact	95	
	Summary	97	
	Problems	97	
2 Statically Determinate Stress Systems	5 Torsion	102	
2.1 Stress: normal, shear and hydrostatic	5.1 Torsion of a thin-walled cylinder	102	
2.2 A statically determinate stress system	5.2 Torsion of a solid circular shaft	103	
2.3 Assumptions and approximations	5.3 Relation between stress, strain and angle of twist	104	
2.4 Tie bar and strut (or column)	5.4 Relation between torque and shear stress	104	
2.5 Suspension-bridge cables	5.5 The torsion relationship	105	
2.6 Thin ring or cylinder rotating	5.6 Torsion of a hollow circular shaft	106	
2.7 Thin shells under pressure	5.7 Torsion of non-uniform and composite shafts	108	
2.8 Shear in a coupling	5.8 Torsion of a thin tube of non-circular section	112	
	5.9 Torsion of thin rectangular strip	115	
	5.10 Effect of warping during torsion	118	

5.11 Torsion of solid rectangular and square cross-sections	119	9.3 Elastic strain energy: normal stress and shear stress	236
Summary	119	9.4 Strain energy in torsion	236
References	120	9.5 Strain energy in bending	237
Problems	120	9.6 Helical springs	240
6 Bending: Stress	125	9.7 Shear deflection of beams	243
6.1 Shear-force and bending-moment distributions	125	9.8 Virtual work	245
6.2 Relationships between loading, shear force and bending moment	125	9.9 Displacements by the virtual work method	246
6.3 Stress distribution in pure bending	125	9.10 Strain energy solutions for forces	248
6.4 Deformation in pure bending	125	9.11 Complementary energy solution for deflections	249
6.5 Stress-strain relationship	130	9.12 Bending deflection of beams	252
6.6 Equilibrium of forces and moments	132	9.13 The reciprocal theorem	257
6.7 The bending relationship	133	Summary	259
6.8 The general case of bending	134	Problems	259
6.9 Section modulus	135		
6.10 Beams made of dissimilar materials	136	10 Buckling Instability	264
6.11 Combined bending and end loading	136	10.1 Stability of equilibrium	264
6.12 Eccentric end loading	137	10.2 Buckling characteristics for real struts	268
6.13 Asymmetrical or skew bending	139	10.3 Eccentric loading of slender columns	274
6.14 Shear stresses in bending	147	10.4 Struts having initial curvature	276
6.15 Bending and shear stresses in I-section beams	148	10.5 Empirical formulae for design	279
6.16 Shear stress in thin-walled open sections and shear centre	151	10.6 Buckling under combined compression and transverse loading	280
6.17 Bending of initially curved bars	156	10.7 Pin-ended strut carrying a uniformly distributed lateral load	281
6.18 Beams with a small radius of curvature	160	10.8 Other examples of instability	284
Summary	164	10.9 Local buckling	285
Reference	168	Summary	287
Problems	196	References	287
	173	Problems	287
	173		
7 Bending: Slope and Deflection	185	11 Stress and Strain Transformations	292
7.1 The curvature-bending-moment relationship	185	11.1 Symbols, signs and elements	292
7.2 Slope and deflection by the double-integration method	185	11.2 Stresses on a plane inclined to the direction of loading	293
7.3 Discontinuous loading: Macaulay's method	186	11.3 Element subjected to normal stresses	294
7.4 Superposition method	193	11.4 Element subjected to shear stresses	295
7.5 Deflections due to asymmetrical bending	202	11.5 Element subjected to general two-dimensional stress system	296
7.6 Beams of uniform strength	204	11.6 Mohr's stress circle	298
Summary	205	11.7 Principal stresses and planes	301
Problems	206	11.8 Maximum shear stress in terms of principal stresses	302
	207	11.9 General two-dimensional state of stress at a point	302
	211	11.10 Maximum shear stress in three dimensions	306
8 Statically Indeterminate Beams	211	11.11 States of strain	307
8.1 Double-integration method	211	11.12 Normal strain in terms of co-ordinate strains	307
8.2 Superposition method	216	11.13 Shear strain in terms of co-ordinate strains	308
8.3 Moment-area method	220	11.14 Mohr's strain circle	310
Summary	232	11.15 Principal strain and maximum shear strain	310
Problems	232	11.16 Experimental stress analysis	311
9 Energy Methods	235	11.17 Rosette strain computation and circle construction	314
9.1 Work done by a single load	235		
9.2 Work done by a single moment	235		

11.18	Spreadsheet solution for strain gauge rosette	317	14.11	Stresses in a rotor of varying thickness with rim loading	403
11.19	Relationships between the elastic constants	319		Summary	407
11.20	Stress and strain transformations in composites	321		Problems	407
11.21	Analysis of a lamina	322			
11.22	Analysis of a laminate	329			
11.23	In-plane behaviour of a symmetric laminate	330			
11.24	Flexural behaviour of a symmetric laminate	334	15	Elementary Plasticity	413
	Summary	334	15.1	Plastic bending of beams: plastic moment	413
	References	335	15.2	Plastic collapse of beams	418
	Problems	335	15.3	Plastic torsion of shafts: plastic torque	423
12	Yield Criteria and Stress Concentration	340	15.4	Plasticity in a pressurized thick-walled cylinder	425
12.1	Yield criteria: ductile materials	340	15.5	Plasticity in a rotating thin disc	429
12.2	Fracture criteria: brittle materials	348	15.6	Residual stress distributions after plastic deformation	431
12.3	Strength of laminates	350		Summary	436
12.4	Concepts of stress concentration	351		Problems	436
12.5	Concentrated loads and contact stresses	353			
12.6	Geometrical discontinuities	356			
12.7	Yield and plastic stress concentration factors	362	16	Thin Plates and Shells	439
	Summary	363	16.1	Assumptions for small deflection of thin plates	439
	References	363	16.2	Relationships between moments and curvatures for pure bending	439
	Problems		16.3	Relationships between bending moment and bending stress	444
13	Variation of Stress and Strain	367	16.4	Relationships between load, shear force and bending moment	444
13.1	Equilibrium equations: plane stress Cartesian co-ordinates	367	16.5	Relationships between deflection, slope and loading	445
13.2	Equilibrium equations: plane stress cylindrical co-ordinates	368	16.6	Plate subjected to uniform pressure	446
13.3	Strain in terms of displacement: Cartesian co-ordinates	370	16.7	Plate with central circular hole	448
13.4	Strain in terms of displacement: cylindrical co-ordinates	370	16.8	Solid plate with central concentrated force	450
13.5	Compatibility equations: Cartesian co-ordinates	373	16.9	Other forms of loading and boundary condition	451
13.6	Compatibility equations: cylindrical co-ordinates	374	16.10	Axi-symmetrical thin shells	453
13.7	Equilibrium in terms of displacement: plane stress Cartesian co-ordinates	374	16.11	Local bending stresses in thin shells	454
	Summary	377	16.12	Bending in a cylindrical storage tank	458
	Problems	377		Summary	459
		378		Bibliography	460
				Problems	460
14	Applications of the Equilibrium and Strain–Displacement Relationships	379			
14.1	Boundary conditions	379	17	Finite Element Method	463
14.2	Shear stress in a beam	380	17.1	Principle of finite element method	463
14.3	Transverse normal stress in a beam	381	17.2	Analysis of uniaxial bars	464
14.4	Stress distribution in a pressurized thick-walled cylinder	381	17.3	Analysis of frameworks	469
14.5	Methods of containing high pressure	382	17.4	Analysis of beam elements	476
14.6	Stresses set up by a shrink-fit assembly	390	17.5	Analysis of continua	483
14.7	Stress distribution in a pressurized compound cylinder	391	17.6	Stiffness matrix for a triangular element	484
14.8	Spreadsheet solution for stress in a compound cylinder	391	17.7	Effect of mesh density	488
14.9	Stress distribution in a thin rotating disc	392	17.8	Other continuum elements	489
14.10	Rotational speed for initial yielding	395		Summary	490
		397		Reference	490
		401		Bibliography	490
				Problems	491

18	Tension, Compression, Torsion and Hardness				
18.1	Stress-strain response in a uniaxial tension test	20.5	Fracture mechanics for fatigue	554	
18.2	Stress-strain response in a compression test	20.6	Influential factors	558	
18.3	Stress-strain response in a torsion test	20.7	Cumulative damage	563	
18.4	Plastic overstrain and hysteresis	20.8	Failure under multi-axial cyclic stresses	564	
18.5	Hardness measurement	20.9	Fatigue of plastics and composites	567	
18.6	Hardness of viscoelastic materials	493	Summary	568	
18.7	Factors influencing strength, ductility and hardness	497	References	569	
	Summary	498	Bibliography	569	
	Reference	500	Problems	569	
	Bibliography	500			
	Problems	506			
19	Fracture Mechanics		21	Creep and Viscoelasticity	573
19.1	Fracture concepts	506	21.1	Stress-strain-time-temperature relationships	573
19.2	Linear-elastic fracture mechanics	510	21.2	Empirical representations of creep behaviour	574
19.3	Strain energy release rate	511	21.3	Creep-rupture testing	577
19.4	Stress intensity factor	511	21.4	Tension creep test equipment	578
19.5	Modes of crack tip deformation	512	21.5	Creep during pure bending of a beam	578
19.6	Experimental determination of critical stress intensity factor	514	21.6	Creep under multi-axial stresses	580
19.7	Fracture mechanics for ductile materials	514	21.7	Stress relaxation	582
19.8	Toughness measurement by impact testing	515	21.8	Stress relaxation in a bolt	583
19.9	Relationship between impact testing and fracture mechanics	516	21.9	Creep during variable load or temperature	584
	Summary	518	21.10	Creep-fatigue interaction	586
	References	521	21.11	Viscoelasticity	587
	Bibliography	521	21.12	Creep behaviour of plastics	588
	Problems	521	21.13	Designing for creep in plastics	590
		525	21.14	Creep rupture of plastics	593
		534	Summary	593
