Preface	11
Introduction	13
List of symbols	16

1 Wind and its characteristics

1.1 General concepts	21
1.2 Wind from the point of view of meteorology	24
1.3 Aerodynamics of civil engineering structures	28
1.4 Wind characteristics	35
1.4.1 Gradient wind speed	36
1.4.2 Maximum wind speed	37
1.4.2.1 Daily maximum speed	38
1.4.2.2 Other expressions of wind speed	41
1.4.3 The mean wind speed	43
1.4.4 Wind as a random process	47
1.4.4.1 Basic concepts of the theory of random processes	48
1.4.4.2 Power spectral density of the wind speed	67
1.4.4.3 Distribution function of the largest values	72
1.4.4.4 Turbulence intensity and integral length	75
1.5 Static wind effects	78
1.5.1 The drag coefficient	80
1.5.2 The lift coefficient	81
1.5.3 The aerodynamic coefficient of other quantities	81
1.6 Dynamic wind effects	81
1.6.1 Dynamic along-wind load	82
1.6.1.1 Simplified expressions for the along-wind static and dynamic loads	88
1.6.1.2 Total aerodynamic admittance	89
1.6.1.3 Normalized spectral density of the wind pressure	90
1.6.1.4 Reduction factor for a horizontal length	91
1.6.2 Across-wind load	93
1.6.2.1 Cylindrical structures	93
1.6.2.2 Structural elements of non-circular cross-section	100
1.6.3 Classical flutter	100
1.6.3.1 Basic relations	100
1.6.3.2 Approximate solution of the critical flutter velocity	103

Contents

1.6.3.3	Torsional flutter	105
1.6.4	Galloping	106
1.6.4.1	Galloping of prismatic bodies	106
1.6.4.2	Effect of turbulence on galloping	110
1.6.4.3	Wake galloping	112
1.6.5	Torsional divergence and panel flutter	115
1.6.6	Buffeting	118
1.6.7	Other wind effects	118
1.7	Wind loading according to some standards	119

2 Structural response

2.1	Effects of deterministic load	123
2.1.1	Method of elasticity constants (stiffness matrices)	123
2.1.1.1	Undamped free vibration	123
2.1.1.2	Undamped forced harmonic vibration	130
2.1.1.3	Damped vibration with viscous damping	133
2.1.2	Method of influence coefficients	135
2.1.3	Slope-deflection method	138
2.1.4	Finite element method	140
2.1.5	Dynamic increment method	144
2.1.6	Some other methods	153
2.1.7	Forced non-harmonic vibration	155
2.1.7.1	Solution by expansion in series of natural modes	155
2.1.7.2	Solution by means of harmonic analysis	157
2.2	Response of a structure to stochastic load	158
2.2.1	Single-degree-of-freedom systems	158
2.2.2	Multi-degree-of-freedom systems	160

3 Model analysis

3.1	Model laws	167
3.2	Modelled air flow	174
3.2.1	Wind tunnels	178
3.2.2	Instrumentation and techniques of wind-tunnel measurement	181
3.3	Aerodynamic models	183
3.4	Aeroelastic models	184

4 Full-scale measurements

4.1	Measured quantities and methods of measurement	188
4.1.1	Tall buildings	188
4.1.2	Masts, towers and stacks	191
4.2	Simulation of wind effects	191

5 Failure of engineering structures

5.1	Local failure	193
5.2	Total failure	196

6 Criteria for estimating wind effects

6.1	Wind-induced fatigue of materials	200
6.1.1	The life of a structure	200

7 Tall buildings

7.1	Mathematical models	204
7.2	Static wind load	205
7.2.1	The drag coefficient	205
7.2.1.1	Aerodynamic coefficients of other quantities	208
7.2.2	Local static wind effects	211
7.2.2.1	Coefficient of external wind pressure	211
7.2.2.2	Coefficient of the tangential wind pressure component	216
7.2.3	Full-scale verification of wind loading	216
7.2.3.1	Effect of building permeability on wind pressure	221
7.2.4	The response of structures	223
7.3	Dynamic wind load	224
7.3.1	Structural dynamics	224
7.3.1.1	Frame structures	224
7.3.1.2	Three-dimensional thin-walled (box) structures	232
7.3.1.3	Two-dimensional systems with concentrated masses	233
7.3.2	Structural response	241
7.3.2.1	Structures of rectangular plan form	243
7.3.2.2	Symmetric structures	244
7.3.2.3	Asymmetric structures	246
7.3.2.4	Structures of general plan form	247
7.3.2.5	Aerodynamic admittance	247
7.3.2.6	Simplified expression of aerodynamic admittance	250
7.3.2.7	Structures solved as discrete systems	251
7.3.2.8	Approximate solution of the response of symmetric structures	253
7.3.2.9	The dynamic coefficient of load	257
7.3.2.10	Examination of vibration on full-scale structures	260
7.3.2.11	Determination of the stiffness matrix from measured natural vibration modes and frequencies	268
7.3.2.12	Methods of measurement and processing of records of the response of tall buildings	271
7.3.3	Damping	277
7.3.4	Local dynamic wind effects	279
7.3.5	Sound effects	282
7.3.6	Loss of aerodynamic stability	282
7.3.7	Buffeting	286
7.3.8	Examples of full-scale measurements of horizontal dynamic deflections and damping of tall buildings	287
7.4	Model measurements	299
7.4.1	Aerodynamic and aeroelastic models	299
7.4.2	Examples of aeroelastic models	301
7.4.3	Spectral densities of pressures and the coherence function	312
7.5	Acceptable amplitudes of horizontal motions	321
7.6	Wind environment around buildings	325

8 Guyed masts

8.1	Types of structures and their mathematical models	328
8.1.1	Discrete models of the mast body	330
8.1.2	Continuous models of the mast body	333
8.1.3	Models of guy ropes	337
8.1.3.1	Guy rope as a massless element	337
8.1.3.2	Effect of the mass of vibrating ropes	343
8.1.4	Torsional vibration of masts	345
8.1.5	Coupled bending-torsional vibration	347
8.2	Static wind load	348
8.2.1	Effect of constant wind speed	348
8.2.2	Quasi-static solution of dynamic wind effect	351
8.3	Along-wind dynamic load	353
8.3.1	Deterministic dynamic load	353
8.3.2	Direct solution of stochastic wind load	353
8.4	Aerodynamic stability	354
8.5	Lateral vibration of mast shafts	354
8.6	Vibration of guy ropes	361
8.6.1	Types of rope vibration	361
8.6.2	Possibilities of rope vibration damping	363
8.7	Measurement of mast vibration	363

9 Towers and stacks

9.1	Types of structures and their mathematical models	367
9.1.1	One-dimensional models	367
9.1.2	Multi-dimensional models	382
9.2	Static wind load	387
9.3	Along-wind dynamic load	388
9.4	Aerodynamic stability	389
9.5	Across-wind (lateral) vibration	389
9.6	Ovalling	391
9.7	Acceptable vibration amplitudes of slender structures	396
9.8	Means to control vibration of slender structures	398
9.8.1	Mechanical means of changing the natural frequency of structures	399
9.8.2	Changing the action of structures	400
9.8.3	Means of increasing structural damping	400
9.8.4	Modification of the flow regime	403
9.8.5	Dynamic vibration absorbers	405
9.8.5.1	Impact absorbers	406
9.8.5.2	Pendulum vibration absorbers	406
9.9	Vibration of full-scale towers	424

10 Cooling towers

10.1	Static load on cooling towers	428
10.2	Stress and strain analysis	438
10.2.1	Linear static analysis	438
10.2.2	Dynamic problems	449

10.2.3	Approximate estimate of the stability of cooling towers	457
10.2.4	Effect of cracks and initial imperfections	464
10.2.5	Non-linear states	469
10.3	Collapse of cooling towers	473
11	Bridges	
11.1	Static wind action	474
11.2	Dynamic wind action	476
11.2.1	Aerodynamic stability of suspension bridges	477
11.2.2	Supression of instability	485
11.2.3	Damping of suspension bridges	488
11.2.4	Local aerodynamic stability	492
11.2.4.1	Columns of the Žďákov bridge	492
11.2.5	Buffeting	498
11.3	Effect of side wind on vehicles	499
11.4	Full-scale measurements	501
11.5	Model measurements	503
11.5.1	Full models	504
11.5.2	Sectional models	506
12	Roofs	
12.1	Plane roofs	510
12.1.1	Static load	510
12.1.2	Dynamic load	512
12.1.3	Model studies	514
12.2	Cable-supported roofs	517
12.2.1	Statics of cable-supported roofs	517
12.2.2	Dynamics of cable-supported roofs	518
12.2.2.1	Unprestressed structures	518
12.2.2.2	Prestressed structures	519
12.2.2.3	Model solution	521
12.2.2.4	Damping and aerodynamic stability of cable-supported roofs	530
12.3	Roofs of general shape	531
12.4	Pneumatic structures	532
12.4.1	Vibration of pneumatic structures	535
13	Permeable structures	537
	Bibliography	542
