Preface	ix
1 Dimensional Analysis and Scaling	1
1.1 Mathematical models	1
1.2 Dimensions	1
1.3 Dimensional analysis	4
1.4 Scaling	17
1.5 Challenging problems	19
1.5.1 The Prandtl–Blasius problem	20
1.5.2 Heat conduction in a bar	23
1.5.3 Water waves	25
2 Conservation Principles and Constitutive Relations	31
2.1 Discrete versus continuous models	32
2.2 Mass and heat balances in one dimension	34
2.3 Constitutive relations in one dimension	40
2.4 Transport theorem	51
2.5 Mass balance in three dimensions	53
2.6 Heat balance in three dimensions	54
2.7 Momentum	54
2.7.1 Stress in continuous media	55
2.7.2 Momentum balance	57
2.7.3 Constitutive relations in three dimensions	58
2.8 Energy balance	62
2.9 Challenging problem: Shallow water waves	64
3 Basic Concepts	69
3.1 State and state space	69
3.1.1 State	70
3.1.2 State space	71
3.1.3 Evolution equations	72
3.2 ODEs	77
3.2.1 Linearizing ODEs	79
3.2.2 Expansions in basis vectors	79

3.2.3	WKB approximation	81
3.3	PDEs	88
3.3.1	Linearizing PDEs	88
3.3.2	Expansions in basis functions	89
3.3.3	Infinite spatial intervals	95
3.3.4	Plane waves	97
3.3.5	Group velocity	100
4	Stability and Robustness	105
4.1	Stability	106
4.2	Stability definitions	112
4.3	Linearization	117
4.4	Robustness	120
4.5	Singular perturbations	125
4.6	Challenging problems	130
4.6.1	Traffic flow	130
4.6.2	Population models	131
4.6.3	Lindstedt's method	132
5	Variational Modeling	135
5.1	Variational principles	136
5.1.1	Optimality in the natural sciences	136
5.1.2	General formulation of optimization problems	137
5.1.3	Principle of minimal potential energy	138
5.2	Variational approximation and restriction	141
5.2.1	General methodology	141
5.2.2	Low- and high-dimensional restrictions	143
5.3	Variational calculus	146
5.3.1	Finite-dimensional problems	146
5.3.2	Basic notions of variational calculus	148
5.4	Variational restriction	156
5.4.1	Ritz–Galerkin projections	157
5.4.2	Variational accuracy	157
5.5	Scientific computing	159
5.5.1	Approximation of the state variables	159
5.5.2	Variational treatment of Sturm–Liouville problems	162
6	Advanced Models	165
6.1	Polymer dynamics and vibrating strings	165
6.1.1	Bead-spring representation	166
6.1.2	Continuous limit	168
6.1.3	Vibrating string	171
6.1.4	Polymer dynamics	171
6.1.5	Brownian motion	174
6.2	Fiber spinning	178
6.2.1	Modeling fiber spinning	179

6.2.2	Newtonian flow	181
6.2.3	Stationary solution	183
6.2.4	Stability analysis	183
6.3	Surface water waves	186
6.3.1	Luke's variational formulation	188
6.3.2	Reformulation and dimension reduction	190
6.3.3	Special cases of wave models by variational restriction . .	194
6.3.4	Spatial discretization of Hamiltonian systems	202
6.4	Optics	204
6.4.1	Introduction	205
6.4.2	Waveguide optics	207
6.4.3	Variational approach to the WKB approximation	213
6.4.4	Transmittance through a finite slab	215
Bibliography		221
Index		225
