Preface	IX
PART I: CRITERIA OF STRUCTURAL OPTIMIZATION	
1 Aims, Basic Concepts and Assumptions	
1.1 The aims and scope of optimization	3
1.2 Basic concepts and definitions	4
1.3 Preliminary assumptions	7
2 Optimization for Minimum Potential Energy, Maximum Rigidity and Minimum Deformability	
2.1 The optimality criterion	9
2.2 Wasiutyński's theorems	10
2.3 Deformability of a structure and the free surface	21
2.4 The necessary and sufficient conditions of minimum deformability	28
2.5 Optimization of plane bar structures	33
2.6 Optimization of plates	57
2.7 Optimization of spatial lattice bar structures	74
3 Uniform Strength Design	
3.1 Strength hypotheses	88
3.2 The criterion of uniform strength	99
3.3 Uniform-strength design of structures under multiple loading conditions	101
3.4 Uniform-strength design of bar structures	106
3.5 Uniform-strength design of beams with cross-sections defined up to m parameters	115
3.6 Uniform-strength design of plates	120
4 Optimization for Minimum Volume, Weight or Cost	
4.1 The criterion of optimization	129
4.2 Optimum elastic design	132
4.3 Examples of optimum elastic design	133

Contents

4.4 Optimum limit design	158
4.5 Examples of optimum limit design	169
4.6 Probabilistic approach to optimum design	180

PART II: METHODS OF STRUCTURAL OPTIMIZATION

5 Introduction to Mathematical Methods of Optimization

5.1 Problem formulation in optimum structural design	191
5.2 Classical extremum theory	196
5.3 Convex regions and convex functions	199

6 Linear Programming

6.1 The linear programming problem	202
6.2 Constrained extrema of a linear function	203
6.3 The graphical method of linear programming	204
6.4 Determination of an initial basic feasible solution	206
6.5 The simplex method	209
6.6 Duality in linear programming.	214
6.7 Other important methods of linear programming	215
6.8 Linear discrete programming	216
6.9 Examples of linear programming in optimum structural design	219

7 Non-linear Programming

7.1 Problem statement	225
7.2 Kuhn-Tucker conditions	226
7.3 Quadratic programming	230
7.4 Duality in quadratic programming	231
7.5 Beale's method	233
7.6 Wolfe's method	236
7.7 Geometric programming: unconstrained problem	239
7.8 Geometric programming: constrained problem	244
7.9 Non-linear integer programming	247
7.10 Unconstrained optimization: direct search methods	249
7.11 Unconstrained optimization: descent methods	254
7.12 Constrained optimization: direct methods	258
7.13 Constrained optimization: indirect methods	261
7.14 Choosing a method	266
7.15 Applications of non-linear programming methods to structural optimization	273

8 Dynamic Programming

8.1 Introduction	287
8.2 Multi-stage decision process	288

8.3	Bellman's principle of optimality	289
8.4	The variant method of dynamic programming.	291
8.5	Applications of dynamic programming to structural optimization	292
8.6	Final to initial value problem conversion	296
8.7	Continuous dynamic programming	297
9	Stochastic Programming	
9.1	Linear stochastic programming	299
9.2	Non-linear stochastic programming	304
9.3	Reliability-based structural optimization: a stochastic programming approach	311
10	Classical Variational Methods. Examples of Application to Optimum Structural Design	
10.1	Introductory remarks and fundamental concepts	314
10.2	Necessary conditions for an extremum of a functional	318
10.3	Variational problems with side conditions	321
10.4	Sufficient conditions for a minimum of a functional	322
10.5	Direct methods in the calculus of variations	323
10.6	Examples of application of the calculus of variations to structural optimization	324
11	Non-classical Variational Methods of Optimization	
11.1	Assumptions and problem formulations	333
11.2	Optimality conditions: necessary and sufficient	335
11.3	Trukhaev-Khomenyuk operator equations	337
11.4	Elimination of inequality constraints	340
11.5	Minimax formulation for non-classical variational problems	344
11.6	Approximate methods for non-classical variational problems	345
12	Mathematical Theory of Extremum Problems	
12.1	Introduction	350
12.2	Cones and dual cones	352
12.3	Necessary extremum conditions	354
12.4	Directions of decrease	357
12.5	Feasible directions	360
12.6	Tangent directions	361
12.7	Calculation of dual cones	364
12.8	The Lagrange multiplier rule and the Kuhn-Tucker theorem	366
12.9	Optimal control problems. Local maximum principle. Pontryagin maximum principle	369
12.10	Sufficient extremum conditions	375

Contents

13 Iterative and Experimental Methods of Shape Optimization of Structures	
13.1 Iterative and experimental approaches to shape optimization	378
13.2 Types of iterations	379
13.3 Iteration vs. imitation and the trial and error method . .	380
13.4 Designing a column for uniform strain	380
13.5 Designing an arch bridge for uniform strain	383
13.6 Determination of an optimum profile of the junction between a beam and a column by means of photo-elastic modelling	386
13.7 Determination of the optimum shape of plane structures .	392
13.8 Shape optimization of shells	398

PART III: BIBLIOGRAPHICAL SURVEY AND BIBLIOGRAPHY

14 Survey of the Literature of Structural Optimization	
14.1 Scope and aim of the survey	407
14.2 Survey works and general studies on structural optimization	408
14.3 Optimization of beams	411
14.4 Optimization of plates	416
14.5 Optimization of trusses	418
14.6 Optimization of columns, arches and frames	420
14.7 Optimization of shells, hanging structures and lattice structures	424
Bibliography of Structural Optimization	426
Author index	526
Subject index	531
