

CONTENTS

PREFACE	9
LIST OF CURRENT SYMBOLS	11
1. FUNDAMENTALS OF THE DYNAMIC ANALYSIS OF STRUCTURES	15
1.1. Dynamic loads and effects	15
1.2. Major characteristics of building materials subjected to dynamic excitation	17
1.2.1. Strength loss due to fatigue	17
1.2.2. Principal steel properties for dynamic stresses	22
1.2.3. Major properties of concrete and reinforced concrete subjected to dynamic excitation	23
1.3. Selection of model for dynamic analysis	28
2. THEORY OF VIBRATION ANALYSIS	31
2.1. Fundamental concepts of vibrations	31
2.2. Vibrations of a single-mass system of one degree of freedom	34
2.2.1. Free undamped vibrations	35
2.2.2. Harmonically excited, undamped vibration	39
2.2.3. Damping	43
2.2.4. Free vibration with viscous damping	44
2.2.5. Harmonically excited vibration with viscous damping	48
2.2.6. Effect of harmonic support vibration	53
2.2.7. Torsional vibrations	55
2.2.8. Vibrations produced by continuous or shock effects	56
2.2.8.1. Intermittent excitation	57
2.2.8.2. The "phase plane" method	60
2.2.8.3. Continuous and periodic excitation	63
2.2.8.4. Force varying continuously with time	65
2.2.9. Vibrations with nonlinear constants	69
2.2.9.1. Free vibrations of a system of nonlinear spring constant	71
2.2.9.2. Numerical solution for nonlinear spring constants	72
2.2.9.3. Vibrations of a system with nonlinear spring characteristics	74
2.2.9.4. Nonlinear damped free vibrations	76
2.2.9.5. Nonlinear damped vibration excited by a harmonic force	77
2.2.9.6. Effect of a shock force on elasto-plastic systems	79
2.2.9.7. A more accurate consideration of the internal friction of the material	82
2.3. Vibrating systems with several masses (degrees of freedom)	89
2.3.1. Free vibrations of systems with two degrees of freedom	89

2.3.2. Forced vibrations of systems with two degrees of freedom	97
2.3.3. General theory of determining the undamped free vibrations of multi-mass vibrating systems (with multi-degrees of freedom)	102
2.3.4. Undamped forced vibrations of multi-mass systems (with several degrees of freedom)	106
2.3.5. Damped free vibrations of multi-mass systems (with several degrees of freedom) .	109
2.3.6. Damped excited vibrations of multi-mass systems (with several degrees of freedom)	111
2.3.7. Effect of the internal material friction	113
2.3.8. Dunkerley's equation for approximating the natural frequency	118
2.4. Vibrations of bars with continuous mass distribution	119
2.4.1. Flexural free vibrations of bars with uniform cross-section	119
2.4.1.1. Orthogonality condition for normal modes	124
2.4.2. Forced flexural vibrations of beams	126
2.4.2.1. System of distributed exciting forces	126
2.4.2.2. Concentrated exciting force	127
2.4.3. Longitudinal free vibrations of straight prismatic bars	130
2.4.4. Torsional free vibrations of straight circular cylindrical bars	132
2.4.5. Free vibrations in shear of straight prismatic bars	133
2.4.6. Determination of flexural free vibrations, taking rotational inertia and shear de- formations into consideration	135
2.4.7. Dunkerley's method for determining the fundamental natural frequency of flexural beams of continuous mass distribution	137
2.5. Analysis of vibrations by energy methods	138
2.5.1. Potential. Potential force. The law of energy conservation	138
2.5.2. The Lagrangian equations	141
2.5.3. The Hamiltonian principle	146
2.5.4. Rayleigh's method	149
2.5.5. The Rayleigh-Ritz method	153
2.5.6. Determination of the natural frequency of plates according to the law of energy conservation	156
2.5.7. Replacement of a continuously distributed mass by a concentrated mass	159
2.5.8. Theorem of virtual displacements	161
2.6. Numerical methods of the dynamic analysis of structures	162
2.6.1. Matrix-iteration method	162
2.6.2. Determination of vibration problems of elastic systems by means of a transfer matrix	167
2.6.2.1. Transfer-matrix determination of natural frequencies	168
2.6.2.2. Transfer-matrix determination of the effect of harmonic excitation	180
2.6.3. Solution of vibration problems for three-dimensional frames	187
2.6.3.1. Bar element characteristics	189
2.6.3.2. Dynamic equations for one bar	191
2.6.3.3. The set of dynamic equations of the bar system	196
2.6.3.4. Computation of forces and reactions	199
2.6.3.5. Consideration of damping	199
2.6.3.6. Experience with numerical analyses of vibrations	200
2.6.4. The finite-element method	202
2.6.4.1. Basic relationships for a single element	202
2.6.4.2. System of dynamic equilibrium equations of nodes of an element (finite- element displacement method)	203

2.6.4.3. The assumed displacement function	205
2.6.4.4. The structure as an entity of finite elements	206
3. DYNAMIC ANALYSIS OF BUILDINGS	207
3.1. Dynamics of high-rise buildings	207
3.1.1. Natural frequency of frame-wall high-rise buildings	207
3.1.1.1. Initial conditions of the analysis	208
3.1.1.2. Natural frequency of hinged frame-wall structures. Model underlying the analysis	209
3.1.1.3. Natural frequency of rigidly connected wall-frame structures	222
3.1.1.4. Natural frequency of wall-framework structures with walls parallel to the frame plane	226
3.1.2. High-rise buildings with composite load-bearing structures	230
3.1.2.1. Computational model	231
3.1.2.2. Fundamental concepts and symbols	232
3.1.2.3. The differential equation system of motion	234
3.1.2.4. Determination of natural frequencies and normal modes	236
3.1.2.5. The exciting effect	241
3.1.2.6. Seismic effect	246
3.1.2.7. Stiffness and dynamic characteristics of systems with masses concentrated at floor levels	248
3.1.2.8. Approximate method for calculating the natural frequency	256
3.2. Aerodynamic effects on buildings	263
3.2.1. Continuous wind load of varying intensity	264
3.2.2. Dynamic effect of turbulent winds	268
3.2.3. Building vibrations due to aerodynamic instability	269
3.2.3.1. Galloping excitation	271
3.2.3.2. Flutter	275
3.2.4. Kármán's air vortices	283
3.3. Stresses in flexural beams due to impact loads	287
3.3.1. Notation	288
3.3.2. Maximum displacement due to shock load	288
3.3.3. Determination of the maximum stresses	293
3.4. Examination of the danger of building vibrations	295
3.4.1. Field measurements of vibration	296
3.4.2. Analyses relying on measurement results	299
3.4.2.1. Calculation of forces arising from dynamic excitation	299
3.4.2.2. Importance of the shaking effect of vibrations	301
3.4.3. Effect of vibrations on humans	308
3.5. Vibration test for checking construction safety	310
3.5.1. Relation between calculated and real stiffness of a structure	311
3.5.2. Two types of dynamic tests for safety	311
3.5.2.1. Calculation-measurement method relying on vibration analysis	312
3.5.2.2. Testing by continuous recording of the natural frequency	314
