|                                                  |           |
|--------------------------------------------------|-----------|
| <b>1. Introduction</b>                           | <b>9</b>  |
| <b>2. Basic concepts</b>                         | <b>13</b> |
| 2.1. Definitions of robots                       | 14        |
| 2.2. Special uses of robots                      | 15        |
| 2.3. Industrial robotics and automation          | 20        |
| 2.4. Classification of industrial robots         | 21        |
| 2.5. Constructions of industrial robots          | 25        |
| 2.6. Technical parameters of industrial robots   | 41        |
| 2.7. Selected constructions of industrial robots | 58        |
| 2.7.1. Five- and six-axis articulated robots     | 59        |
| 2.7.2. Parallel robots                           | 63        |
| 2.7.3. SCARA robots                              | 68        |
| 2.7.4. Portal robots                             | 70        |
| 2.7.5. Two-arm robots                            | 71        |
| 2.7.6. Collaborative robots                      | 77        |
| 2.8. Coordinate systems of industrial robots     | 82        |
| <b>3. Effectors of industrial robots</b>         | <b>88</b> |
| 3.1. Grippers                                    | 88        |
| 3.2. Robotic tools                               | 99        |
| 3.3. Tools change systems                        | 100       |

|                                                                                        |            |
|----------------------------------------------------------------------------------------|------------|
| <b>4. Sensors and sensory systems of industrial robots</b>                             | <b>103</b> |
| 4.1. Measurement sensors                                                               | 103        |
| 4.2. Vision systems                                                                    | 120        |
| <b>5. The use of industrial robots in selected applications</b>                        | <b>134</b> |
| 5.1. The advantages of robotization                                                    | 135        |
| 5.2. Robotic welding stations                                                          | 136        |
| 5.3. Packaging machines vs. robots                                                     | 140        |
| 5.4. New markets for robotics                                                          | 142        |
| 5.5. Work in dangerous conditions                                                      | 142        |
| 5.6. Constant development of robotics                                                  | 145        |
| <b>6. Analysis of robotic sorting, packaging and palletizing processes</b>             | <b>147</b> |
| 6.1. Designing robotic positions for sorting, packing and<br>palletizing of goods      | 149        |
| 6.2. Structure of robotic sorting, packaging and palletizing workstations              | 150        |
| 6.2.1. Robotic sorting of goods                                                        | 152        |
| 6.2.2. Robotic packaging of goods                                                      | 154        |
| 6.2.3. Robotic palletizing of goods                                                    | 156        |
| 6.3. Safety and work environment at sorting, packaging and<br>palletizing workstations | 161        |
| 6.4. Examples of robotic packaging and palletizing stations                            | 164        |
| <b>7. Robotic processes of welding and laser welding and cutting</b>                   | <b>170</b> |
| 7.1. Robotic processes of arc welding                                                  | 171        |
| 7.2. Robotic processes of spot welding                                                 | 182        |
| 7.3. Examples of robotic spot welding stations                                         | 194        |
| 7.4. Robotic processes of laser welding and cutting                                    | 198        |
| 7.5. Summary                                                                           | 209        |
| <b>8. Robotic machine tending</b>                                                      | <b>210</b> |
| 8.1. Robotic tending of machining centers                                              | 210        |
| 8.2. Robotic tending of plastic forming stations                                       | 215        |

|                                                                              |     |
|------------------------------------------------------------------------------|-----|
| <b>9. Robotic assembly</b>                                                   | 220 |
| 9.1. Types of assembly stations                                              | 224 |
| 9.2. Summary                                                                 | 229 |
| <b>10. Programmable Logic Controllers (PLCs) in robotic production cells</b> | 231 |
| 10.1. Position of PLCs in industry                                           | 232 |
| 10.2. Construction, operation and programming of PLCs                        | 232 |
| 10.3. Immigration of drivers to robot controllers                            | 235 |
| 10.3.1. Examples of solutions                                                | 236 |
| 10.4. Summary                                                                | 245 |
| <b>11. Safety systems at robotic work stations</b>                           | 246 |
| 11.1. Machine safety in the aspect of standards requirements                 | 247 |
| 11.2. Categories of safety                                                   | 249 |
| 11.3. Safety in a robotic production cell                                    | 255 |
| 11.4. Safety systems vs. control systems of industrial robots                | 259 |
| 11.5. Summary                                                                | 265 |
| <b>12. The market of robotics, review of new solutions and trends</b>        | 266 |
| 12.1. The density of robotization                                            | 269 |
| 12.2. Predictions on the development of robotization                         | 270 |
| 12.3. The main factors influencing the development of robotization           | 270 |
| 12.4. Trends in the development of industrial robots                         | 272 |
| 12.4.1. Construction of manipulators                                         | 272 |
| 12.4.2. Generations of controllers                                           | 276 |
| 12.4.3. Development of operator panels – Teach Pendant panels                | 279 |
| 12.4.4. Development of safety systems of industrial robots                   | 281 |
| 12.4.5. Development of the environments for programming industrial robots    | 283 |
| 12.4.6. Integrated systems for quick implementation                          | 286 |
| <b>13. References</b>                                                        | 288 |
