FOREWORD ix

PREFACE xi

NOTATION xiii

1. **Dynamic Systems** 1
   - 1.1 System concepts 1
   - 1.2 Open-loop systems 3
   - 1.3 "Feedback"—closed-loop systems 6
   - 1.4 The phase-plane diagram 9

2. **Route Capacity—Laws for Vehicle Following** 18
   - 2.1 Lane capacity 18
   - 2.2 Car-following theory 19
   - 2.3 Automatic vehicle systems 26

3. **Control of Vehicle Spacing—Railway Signalling** 31
   - 3.1 Necessity for signalling on railways 31
   - 3.2 The "train-order" system 33
   - 3.3 The "block" system 33
   - 3.4 Lock and block 35
   - 3.5 Multiple-aspect signalling 36

4. **Problems of Congestion—Traffic Regulation** 41
   - 4.1 Random events 41
   - 4.2 Queues—Poisson arrivals—constant service times 41
   - 4.3 Exponential service times 43
   - 4.4 Effect of delays on headway of signalled systems 43
   - 4.5 Statistical aspects of car-following behaviour 46
   - 4.6 Traffic waves 49

5. **Computer Aids to Operation—Traffic Surveillance and Control** 52
   - 5.1 Application of digital computers 52
   - 5.2 Continuous progress control (C.P.C.), Dynamic programming 52
   - 5.3 Optimum train sequence 55
   - 5.4 Traffic surveillance and control 56
   - 5.5 Control of cascaded vehicles 59
   - 5.6 System flow charts 60
   - 5.7 Train describers 60

6. Measurement of Power—Analogue Computing 63

6.1 Mechanical manipulation of data 63
6.2 Equivalent mechanical and electrical quantities 66
6.3 Potential and flow 66
6.4 Operational amplifiers 66
6.5 Vehicle suspension analogy 68
6.6 Application to strings of vehicles 71
6.7 Hybrid computers 73
6.8 Simulation of service environment 74

7. Vehicle Detection 76

7.1 Presence detectors 76
7.2 Track circuits 76
7.3 Jointless track circuits 78
7.4 Guided radar 79

8. Vehicle Identification 84

8.1 The "Identra" system 84
8.2 Bus electronic scanning indicator 84
8.3 Automatic wagon-recording system 87

9. Communication of Control Signals to Moving Vehicles 89

9.1 Automatic warning systems—cab signalling 89
9.2 The "Indusi" system 91
9.3 The "Signum" system 92
9.4 Beacon devices 92
9.5 Coded track circuit 94
9.6 Professor Poupé's system of coded track circuits 94
9.7 Use of continuous conductors in the track 96
9.8 Combination of magnetic and inductive loop systems 100

10. Interlocking—Sequence Control 102

10.1 Mechanical interlocking 102
10.2 Boolean algebra 104

11. Sorting and Marshalling 107

11.1 The hump yard 107
11.2 Automatic retarders 108
11.3 Dowty retarders 109

12. Control of Acceleration and Power 112

12.1 Limitations 112
12.2 Equations of motion 113
12.3 Values of resistance coefficient 114
12.4 Estimation of distance–time relationships 117
12.5 Coasting 118
12.6 Control of engine speed 120
12.7 Automatic transmissions 123

12.8 Control of electric motive power 125
12.9 Use of transductors in power control 128
12.10 Application of induction motors 130
12.11 Wheel-slip control 134
12.12 Control of diesel power 139
12.13 Adaptive control 141
12.14 Shock factors in acceleration 141

13. **Control of Braking** 146

13.1 Forms of braking 146
13.2 Physiological aspects 149
13.3 Control of slip (slow up) 149
13.4 "On-tread" braking 152
13.5 "Off-tread" braking 153
13.6 Servo actuation 154
13.7 The compressed-air brake 155
13.8 The electro-pneumatic (E.P.) brake 156
13.9 The vacuum brake 157

14. **Steering—Directional Stability** 159

14.1 Steering 159
14.2 Directional stability 162
14.3 Hertzian contact 165
14.4 Running of coned wheels 168
14.5 Inscription within sharp curves—steering by flanges 169
14.6 Oscillation of bogies 171
14.7 Motion on curves at speed 174
14.8 Effect of oscillation on passengers 174

15. **Automatic Railways** 177

15.1 General principles 177
15.2 Analysis of human contribution under the present system 178
15.3 Possible systems for intensively used passenger lines 181
15.4 Existing installations 182
15.5 Systems for high-speed working 189

16. **Possibilities for the Future** 192

16.1 The need for development of new transport modes 192
16.2 Possible improvements in control on the highway 194
16.3 High capacity systems—effect of station stops 197
16.4 Mono- and duorails 200
16.5 Transit expressways 201
16.6 Steerable wheels 202
16.7 Blake system 203
16.8 Air-cushion support 204
16.9 Linear motors 207

Appendix I 223
Theory of Control 223

1. Equivalence of dynamic and active systems 223
2. Literature available 228

3. The Laplace transform–transfer function 228
4. Effect of time delay 232
5. Criteria for stability 233
6. Root locus plots 234
7. Nyquist and Bode representation 236
8. Common forms of non-linearity 241
9. The describing function 243
10. Inverse Nyquist or Whitely diagram 245
11. Liapunov's second method 246
12. Random inputs 247
13. On-line control—sampled data 247

Appendix II
The S.I. Units 248

1. Advantages and use of system 248
2. Conversion factors 249
