

CONTENTS

1. INTRODUCTION	7
2. NOISE AND VIBRATION IN TRANSPORT – SELECTED PROBLEMS	8
2.1. Noise and its environmental impact	8
2.2. The application of vibroacoustic methods in diagnosing the technical condition	13
2.2.1. Diagnosing gear transmissions	14
2.2.2. Diagnosing combustion engines	16
3. RESEARCH ON THE ENVIRONMENTAL IMPACT OF MEANS OF TRANSPORT	19
3.1. Analysis of the influence of different means of transport on the level of traffic noise	19
3.2. Examination of the influence of selected road surface types and traffic speed on the traffic noise level	29
3.3. The influence of the exhaust muffler type in a sports motorcycle on the emitted noise level	33
3.4. Stand tests of the influence of helmet type on the noise reaching the motorcyclist	40
3.5. The effect of travelling speed and propulsion type on the sound level in the passenger compartment of a vehicle with a hybrid propulsion system	45
4. MEASUREMENT AND PROCESSING OF SIGNALS IN DIAGNOSING GEAR TRANSMISSIONS	52
4.1. The diagnosing gearboxes of means of transport using method multi-stage filtration and entropy	52

4.2. Diagnosis the wear and chipping of gears in the gearbox using the wavelet packet transform	66
4.3. A method of diagnosing damage to rolling bearings	76
5. MEASUREMENT AND PROCESSING OF SIGNALS IN DIAGNOSING DAMAGE TO COMBUSTION ENGINES	85
5.1. Application of a continuous wavelet transform for the diagnosing of excessive valve clearance of the combustion engine	85
5.2. Assessment of changes in noise and vibration of an engine during its start-up	93
5.3. Assessment of possibility of using the vibration of the common rail system in the Diesel engine condition monitoring	100
5.4. The timing chain tensioner damage diagnosing by the using of a continuous wavelet transform	104
6. CONCLUSIONS	115
BIBLIOGRAPHY	120
Abstract	142
