<i>Preface</i>	v
<i>Acknowledgements</i>	vii
Chapter 1 Site Investigation and Soil Testing.	1
1.1 The Nature of Engineering Soils	1
1.1.1 The formation of engineering soils	1
1.1.2 Ground-water.	2
1.1.3 The need for a site investigation	3
1.2 Site Investigation Methods.	3
1.2.1 Sources of preliminary information	4
1.2.2 The trial pit.	4
1.2.3 The borehole	6
1.2.4 Sample retrieval	8
1.2.5 Disturbance of soil by boring operation	8
1.2.6 Sample disturbance due to temperature change	8
1.2.7 Geophysical methods	12
1.3 <i>In-Situ</i> Testing	12
1.3.1 The standard penetration test (SPT)	12
1.3.2 The static penetrometer.	13
1.3.3 The pressuremeter	17
1.3.4 The vane test.	17
1.3.5 The plate bearing test.	19
1.4 Index Tests	21
1.4.1 Grading analysis	21
1.4.2 Particle size classification.	21
1.4.3 Grading analysis of fines	22
1.4.4 Roundness and sphericity.	22
1.4.5 Bulk density and dry density	22
1.4.6 Determination of bulk density and dry density.	24
1.4.7 Water content	24
1.4.8 Specific gravity of soil particles	25
1.4.9 Void ratio, porosity and degree of saturation.	25

1.4.10	Moisture content and consistency.	27
1.4.11	The liquid limit test	27
1.4.12	The plastic limit test.	29
1.4.13	The shrinkage limit	29
1.4.14	Soil classification.	29
1.5	Permeability	33
1.5.1	Superficial velocity and seepage velocity.	33
1.5.2	Hydraulic gradient.	33
1.5.3	Darcy's law	36
1.5.4	The constant head permeameter.	37
1.5.5	The falling head permeameter	39
1.5.6	The pumping out test	40
1.5.7	The borehole permeability test	40
1.5.8	Determination of the permeability of cohesive soils . . .	43
1.5.9	Typical values of coefficient of permeability.	43
1.5.10	Factors affecting the reliability of test data	45
1.6	Oedometer Testing	46
1.6.1	The oedometer cell	46
1.6.2	Load application.	47
1.6.3	Sample dimensions and index properties.	47
1.6.4	Limitations of the oedometer test.	47
1.7	Triaxial Testing.	48
1.7.1	The triaxial cell.	48
1.7.2	Preparation of the cell for a test	49
1.7.3	Preparing saturated samples of cohesionless soil	51
1.7.4	Preparing dry samples of cohesionless soil	51
1.7.5	Preparing samples of remoulded cohesive soil	51
1.7.6	Preparing undisturbed samples of cohesive soil.	52
1.7.7	Test procedure	53
1.7.8	Limitations of the conventional triaxial test.	55
1.7.9	Properties of the triaxial sample before and after testing . . .	60
1.7.10	The stress path cell	60
1.7.11	The hollow cylinder apparatus	61
1.7.12	The true triaxial apparatus.	62
1.8	Shear Testing.	62
1.8.1	Types of shear test apparatus	62
1.8.2	The shear box	62
1.8.3	The ring shear apparatus.	64
1.8.4	The simple shear apparatus	65
Chapter 2	Some Rheological Concepts	67
2.1	Rheological Models	67
2.1.1	Elasticity and plasticity	67
2.1.2	Mechanical analogues.	68
2.1.3	Soil microstructure.	69
2.1.4	Viscosity.	70
2.1.5	Thixotropy.	72

2.1.6	A general equation for viscous and thixotropic materials	72
2.1.7	Elastico-viscosity and visco-elasticity	73
2.1.8	Creep.	75
2.1.9	Stress relaxation	76
2.1.10	Kelvin, Maxwell and Berger systems.	76
2.1.11	The theories of Murayama and Shibata (1964) and Christensen and Wu (1964).	79
2.2	Soil Mineralogy	80
2.2.1	The nature of the contact zones.	80
2.2.2	The mineralogy of clays	85
2.2.3	Types of clay mineral	85
2.2.4	Inter-atomic bonding	85
2.2.5	The atom	86
2.2.6	Protons and neutrons.	87
2.2.7	Ionic bonds	87
2.2.8	Valency bonds	87
2.2.9	Molecules	87
2.2.10	Hydrogen bonds	87
2.2.11	The adsorbed water layer.	88
2.2.12	Ion exchange	88
2.2.13	Van der Waals forces	89
2.2.14	The cardhouse structure of clay particles	89
2.2.15	Flocculation and dispersion	90
2.3	The Interpretation of Index Test Results.	91
2.3.1	Particle size distribution	91
2.3.2	Atterberg limits.	92
2.3.3	Liquidity index	93
2.3.4	Activity ratio	93
2.3.5	Relative density	94
Chapter 3	The Development of Rheological Equations for Soils .	95
3.1	Stress and Strain	95
3.1.1	Definitions of stress at a point.	95
3.1.2	Strain	96
3.1.3	Sign convention	99
3.1.4	Plane stress and plane strain	100
3.1.5	Axisymmetric stress and strain	101
3.1.6	Various coordinate systems	104
3.1.7	Total and effective stresses	104
3.1.8	The condition necessary for soil deformation to occur .	105
3.1.9	Possible modes of deformation	105
3.1.10	The behaviour of an assembly of uniform rods.	105
3.1.11	Choice of stress function for symmetrical shear distortion	108
3.1.12	Stress function for compression without shear distortion	109
3.1.13	Choice of stress function for asymmetric shear distortion	112
3.1.14	The deformation of real soils	112

3.1.15	Choice of stress functions for the three-dimensional case	112
3.1.16	The concept of stress level	113
3.1.17	Anisotropy	113
3.1.18	Stress history	114
3.2	Rheological Equations for Vertical Strain Rate	114
3.2.1	Symmetrical shear distortion (mode 'a')	115
3.2.2	Compression without shear distortion (mode 'b').	115
3.2.3	Asymmetric shear distortion (mode 'c').	116
3.2.4	The general case	116
3.3	Rheological Equations for Volume Change	118
3.3.1	Symmetrical shear distortion.	118
3.3.2	Compression without shear distortion	121
3.3.3	Asymmetric shear distortion	121
3.3.4	Compression and shear distortion combined	122
3.3.5	Pore pressure induced by volume change	122
3.4	Rate Process Theory	123
3.4.1	Rate processes	125
3.4.2	The flow unit	125
3.4.3	Activity	126
3.4.4	The effect of an applied stress	126
3.4.5	Strain rate prediction	128
3.4.6	Physical significance of the soil parameters B , m and a	128
3.4.7	The effect of temperature changes on soil behaviour	129
3.4.8	Typical values of contact zone parameters	131
Chapter 4	The Interpretation of Test Data	132
4.1	Oedometer Test Data	132
4.1.1	Processing oedometer test data	132
4.1.2	The behaviour of normally and overconsolidated cohesive soils	134
4.1.3	Preconsolidation pressure and overconsolidation ratio	136
4.1.4	Parameters which define the compressibility of soils.	136
4.1.5	Total stresses applied to the oedometer sample	138
4.1.6	Effective stresses applied to the oedometer sample.	139
4.1.7	Mean effective pressure and stress ratio	139
4.1.8	Rheological equations applicable to the oedometer test.	140
4.1.9	Definition of volumetric strain increment	141
4.1.10	Relationships between conventional and rheological parameters	141
4.1.11	Rheological models for swelling and recompression	142
4.1.12	Secondary consolidation	143
4.1.13	The determination of permeability from oedometer test data	144
4.1.14	Transient flow	144
4.1.15	The Terzaghi one-dimensional consolidation theory.	147
4.1.16	The determination of c_v from the settlement-time data	147
4.1.17	The secondary consolidation effect	152

4.1.18	Consolidation theories	152
4.2	Triaxial Test Data	153
4.2.1	Processing triaxial test data	154
4.2.2	Total stresses applied to the triaxial sample.	159
4.2.3	Effective stresses applied to the triaxial sample.	159
4.2.4	Mean effective pressure and stress ratio	159
4.2.5	Rheological equations applicable to the triaxial test. . .	160
4.2.6	Triaxial consolidation	160
4.2.7	Use of rheological equations to predict soil behaviour .	161
4.2.8	Method of selecting values of parameters used in the program	162
4.2.9	Sensitivity analysis.	162
4.2.10	Trends of behaviour of soils in the triaxial test.	162
4.2.11	Physical significance of the results of the analysis . . .	165
4.2.12	The concept of failure.	166
4.2.13	Factors affecting the value of ϕ' for cohesionless soils. .	169
4.2.14	Cohesive strength	169
4.2.15	Total stress shear strength parameters	171
4.2.16	Post-failure behaviour	172
4.2.17	The significance of stress path	173
4.2.18	The interpretation of data from the true triaxial test . .	174
4.3	Cyclic Loading Test Data	175
4.3.1	Typical response of soils to cyclic loading.	175
4.3.2	A model for cyclic behaviour	178
4.3.3	Contact zone properties and cyclic behaviour	180
4.4	Shear Test Data	180
4.4.1	Total stresses applied to the simple shear test sample. .	180
4.4.2	Determination of effective stresses.	182
4.4.3	Mean effective pressure and stress ratio	182
4.4.4	Rheological equations applicable to the simple shear test	183
4.4.5	Evaluation of shear strength parameters from shear box data	183
4.4.6	Analysis of data from the ring shear apparatus.	183
4.4.7	Post-failure behaviour of soils	185
4.5	Some Empirical Rheological Equations	185
4.5.1	The hyperbolic stress-strain law.	185
4.5.2	The Skempton equation for pore water pressure change	186
4.5.3	The creep equations of Singh and Mitchell (1968). . . .	188
4.5.4	Relationship between residual angle of shearing resis- tance and percent clay fraction	189
4.5.5	Relationship between undrained shear strength and plas- ticity index	189
4.5.6	Relationship between compression index and liquid limit	191
4.6	<i>In-Situ</i> Test Results	191
4.6.1	The standard penetration test (SPT)	191
4.6.2	The static penetration test (Dutch cone).	193
4.6.3	The pressuremeter	195
4.6.4	The vane test.	196

Appendix A: Program for the Interpretation of Triaxial Test Data (BASIC; Hewlett–Packard Computer)	197
Appendix B: Program for the Interpretation of Cyclic Loading Test Data (BASIC; Hewlett–Packard Computer)	199
Chapter 5 Elasticity and Plasticity Theory	202
5.1 The Elasticity Model	202
5.1.1. Hooke's law and Poisson's ratio	202
5.1.2 The elasticity equations for an isotropic material	202
5.1.3 Elasticity equations for an anisotropic material	204
5.1.4 Determination of elastic parameters for soils	205
5.1.5 Undrained and drained elastic parameters.	205
5.2 Elasticity Solutions	205
5.2.1 Equilibrium and compatibility equations.	206
5.2.2 The theory of elasticity	207
5.2.3 Elastic solutions for soil mechanics.	207
5.2.4 Total and effective stress solutions	209
5.2.5 Limitations of the elasticity approach	212
5.2.6 Determination of vertical stresses in a soil mass at rest.	214
5.3 The Plasticity Model	214
5.3.1 Yield	214
5.3.2 Plastic, elasto-plastic and strain-hardening models.	215
5.3.3 The yield surface.	216
5.3.4 The yield function	216
5.3.5 The flow rule	218
5.3.6 Dilatancy and plastic work.	220
5.3.7 The hardening law.	221
5.3.8 The hardening law for cohesive soil	221
5.3.9 The Cam-clay model	222
5.4 Plasticity Solutions	224
5.4.1 Slip line and limit equilibrium methods	224
5.4.2 Effective and total stress solutions	224
5.4.3 The slip line method	225
5.4.4 Determination of stress levels in a collapse zone.	227
5.4.5 The Rankine theory of lateral earth pressure	228
5.4.6 The limit equilibrium method	232
5.4.7 Limitations of plasticity solutions.	232
5.5 Some Limit Equilibrium Solutions	233
5.5.1 Factor of safety	233
5.5.2 The bearing capacity of foundations	234
5.5.3 Possible failure mechanisms for a strip footing	235
5.5.4 Simplified derivation of the Meyerhof bearing capacity equation	235
5.5.5 The Terzaghi bearing capacity theory	241
5.5.6 Shape factors	242
5.5.7 Net bearing capacity	242

5.5.8	The special case of $\phi = 0$	242
5.5.9	Bearing capacity in terms of effective stress	243
5.5.10	The analysis of slope stability	243
5.5.11	Surface instability	243
5.5.12	Procedure for the analysis of slopes in cohesive soil. . .	245
5.5.13	The Bishop method of slices	247
5.5.14	Procedure for a hand calculation	250
5.5.15	The Swedish method of slices	251
5.5.16	The Bishop and Morgenstern stability coefficients m and n	251
5.5.17	Determination of the average pore pressure ratio	253
5.5.18	The depth factor D	254
5.5.19	The special case of $\phi = 0$	255
5.5.20	The Coulomb lateral earth pressure theory	255
5.5.21	Determination of active and passive thrusts by the graphical method	256
Appendix: Stability Coefficients for Earth Slopes		261
Chapter 6 Numerical Methods of Analysis		274
6.1	Matrix Algebra	274
6.1.1	Matrix notation for elasticity equations	274
6.1.2	Manipulation of matrices	275
6.1.3	The $[D]$ matrix for an isotropic elastic material	276
6.2	The Finite Difference Method	277
6.2.1	Finite difference equations for one-dimensional consolidation	277
6.2.2	Example of the application of the consolidation equation .	278
6.2.3	Computer program used to solve consolidation example .	280
6.2.4	Slip line analysis by the Sokolovski method	282
6.2.5	Solution of the Sokolovski equations	284
6.2.6	The finite difference solution of steady-state flow problems.	285
6.2.7	The steady-state flow equation	286
6.2.8	Finite difference solution of steady-state flow equation .	286
6.2.9	The special case of an impermeable boundary	289
6.2.10	Determination of pore water pressures	290
6.2.11	Determination of seepage rate	290
6.2.12	Flow net sketching	291
6.2.13	Flow nets for seepage through earth dams	291
6.3	The Finite Element Method	294
6.3.1	The finite element model	294
6.3.2	The concept of element stiffness	294
6.3.3	Assembly stiffness	298
6.3.4	The finite element solution	300
6.3.5	Determination of strain components from nodal displacements	300

6.3.6	Determination of stress components	302
6.3.7	Evaluation of the element stiffness coefficients k	302
6.3.8	Typical program operations	303
6.3.9	Application of finite element method to non-linear materials.	304
6.3.10	The variable stiffness method	304
6.4	An Example of the Use of the Variable Stiffness Finite Element Method.	305
6.4.1	Rheological equations applicable to the finite element solution	305
6.4.2	Formulation of constitutive equations	309
6.4.3	Discussion of the results obtained using the program	311
