

Contents

Abbreviated terms	7
Introduction	9
Chapter 1	
Range of problems of the direct-current traction system electromagnetic compatibility	11
1.1. General issues of the direct-current traction system electromagnetic compatibility	11
1.2. Aspects of the direct-current traction system electromagnetic compatibility	20
1.3. Aspects of electric rolling stock electromagnetic compatibility	32
1.4. Aspects of electromagnetic compatibility of the modern line systems	37
1.5. Rationing of the direct-current traction system electromagnetic compatibility	41
Chapter 2	
Experimental research of electromagnetic compatibility of direct-current traction energy sub-systems	53
2.1. Research theoretical aspects and practical implementation	53
2.2. 3.3 kv buses voltage quality	58
2.3. Estimation of direct-current traction substation smoothing passive filters operational efficiency	62
2.4. Research of electromagnetic processes in the overhead system	66
2.4.1. General approaches to description of electromagnetic processes occurring in the direct-current traction network	66
2.4.2. Research of impedance characteristics	74
2.4.3. Resonance phenomena in the overhead system	77
2.5. Research of electric rolling stock current and voltage harmonic content	91
2.5.1. Research of voltage harmonics generated by the electric locomotive	91
2.5.2. Research of current harmonics generated by the electric locomotive	96
2.5.3. Research of electric locomotive current harmonics recorded in substation return feeder	100
2.6. Research of current harmonic distortions in the rail network	102
2.6.1. Research of harmonic distortions on railway haul	102
2.6.2. Research of harmonic distortions in traction substation return feeder	107
2.7. Magnetic Fields Generated by Vehicles in Traction System	111
2.7.1. Tests of magnetic fields generated by rolling stock	112
2.7.2. Sample research results	113
2.7.3. Electromagnetic fields generated by electric and combustion powered rolling stock	116

Chapter 3

Simulation of electromagnetic interferences in the direct-current traction energy subsystems	119
3.1. Methodological approach to the simulation of interferences.....	119
3.2. Simulation of interferences in the alternating current subsystem.....	121
3.3. Simulation of interferences in the direct current subsystem.....	133
3.4. Simulation of interferences in the rail track circuits.....	138
3.4.1. Generalized approach	138
3.4.2. Computer-aided analysis	144

Chapter 4

Improvement of electromagnetic compatibility of direct-current traction energy subsystems at introduction of high-speed operation	153
4.1. Requirements for the electric-power channels of direct-current traction energy	153
4.2. Electromagnetically compatible combined principle rectifiers	154
4.3. Improvement of electric-power channel infrastructure overvoltage protection	162
4.4. Reduction of interference levels from the overvoltage's in the rail network.....	174
4.5. Improvement of pantograph and contact wire interaction performance.....	182
4.6. Improvement of railway automation devices performance	187
4.6.1. Receivers of IBS devices with regard to interferences.....	189
Bibliography	193
