<i>Preface to Volume 2</i>	xiii
1. General problems in solid mechanics and non-linearity	1
1.1 Introduction	1
1.2 Small deformation non-linear solid mechanics problems	3
1.3 Non-linear quasi-harmonic field problems	12
1.4 Some typical examples of transient non-linear calculations	14
1.5 Concluding remarks	20
References	20
2. Solution of non-linear algebraic equations	22
2.1 Introduction	22
2.2 Iterative techniques	23
References	36
3. Inelastic and non-linear materials	38
3.1 Introduction	38
3.2 Viscoelasticity – history dependence of deformation	39
3.3 Classical time-independent plasticity theory	48
3.4 Computation of stress increments	56
3.5 Isotropic plasticity models	61
3.6 Generalized plasticity – non-associative case	68
3.7 Some examples of plastic computation	71
3.8 Basic formulation of creep problems	75
3.9 Viscoplasticity – a generalization	78
3.10 Some special problems of brittle materials	84
3.11 Non-uniqueness and localization in elasto-plastic deformations	88
3.12 Adaptive refinement and localization (slip-line) capture	93
3.13 Non-linear quasi-harmonic field problems	101
References	104
4. Plate bending approximation: thin (Kirchhoff) plates and C_1 continuity requirements	111

4.1	Introduction	111
4.2	The plate problem: thick and thin formulations	113
4.3	Rectangular element with corner nodes (12 degrees of freedom)	124
4.4	Quadrilateral and parallelogram elements	128
4.5	Triangular element with corner nodes (9 degrees of freedom)	128
4.6	Triangular element of the simplest form (6 degrees of freedom)	133
4.7	The patch test – an analytical requirement	134
4.8	Numerical examples	138
4.9	General remarks	145
4.10	Singular shape functions for the simple triangular element	145
4.11	An 18 degree-of-freedom triangular element with conforming shape functions	148
4.12	Compatible quadrilateral elements	149
4.13	Quasi-conforming elements	150
4.14	Hermitian rectangle shape function	151
4.15	The 21 and 18 degree-of-freedom triangle	153
4.16	Mixed formulations – general remarks	155
4.17	Hybrid plate elements	157
4.18	Discrete Kirchhoff constraints	158
4.19	Rotation-free elements	162
4.20	Inelastic material behaviour	164
4.21	Concluding remarks – which elements?	166
	References	167
5.	‘Thick’ Reissner–Mindlin plates – irreducible and mixed formulations	173
5.1	Introduction	173
5.2	The irreducible formulation – reduced integration	176
5.3	Mixed formulation for thick plates	180
5.4	The patch test for plate bending elements	183
5.5	Elements with discrete collocation constraints	187
5.6	Elements with rotational bubble or enhanced modes	196
5.7	Linked interpolation – an improvement of accuracy	199
5.8	Discrete ‘exact’ thin plate limit	202
5.9	Performance of various ‘thick’ plate elements – limitations of thin plate theory	203
5.10	Forms without rotation parameters	208
5.11	Inelastic material behaviour	210
5.12	Concluding remarks – adaptive refinement	211
	References	212
6.	Shells as an assembly of flat elements	216
6.1	Introduction	216
6.2	Stiffness of a plane element in local coordinates	218
6.3	Transformation to global coordinates and assembly of elements	219
6.4	Local direction cosines	221
6.5	‘Drilling’ rotational stiffness – 6 degree-of-freedom assembly	225
6.6	Elements with mid-side slope connections only	230

6.7	Choice of element	230
6.8	Practical examples	231
	References	240
7.	Axisymmetric shells	244
7.1	Introduction	244
7.2	Straight element	245
7.3	Curved elements	251
7.4	Independent slope–displacement interpolation with penalty functions (thick or thin shell formulations)	261
	References	264
8.	Shells as a special case of three-dimensional analysis – Reissner–Mindlin assumptions	266
8.1	Introduction	266
8.2	Shell element with displacement and rotation parameters	266
8.3	Special case of axisymmetric, curved, thick shells	275
8.4	Special case of thick plates	277
8.5	Convergence	278
8.6	Inelastic behaviour	279
8.7	Some shell examples	280
8.8	Concluding remarks	285
	References	286
9.	Semi-analytical finite element processes – use of orthogonal functions and ‘finite strip’ methods	289
9.1	Introduction	289
9.2	Prismatic bar	292
9.3	Thin membrane box structures	295
9.4	Plates and boxes with flexure	296
9.5	Axisymmetric solids with non-symmetrical load	297
9.6	Axisymmetric shells with non-symmetrical load	303
9.7	Finite strip method – incomplete decoupling	305
9.8	Concluding remarks	308
	References	309
10.	Geometrically non-linear problems – finite deformation	312
10.1	Introduction	312
10.2	Governing equations	314
10.3	Variational description for finite deformation	319
10.4	A three-field mixed finite deformation formulation	328
10.5	A mixed–enhanced finite deformation formulation	332
10.6	Forces dependent on deformation – pressure loads	336
10.7	Material constitution for finite deformation	338
10.8	Contact problems	347
10.9	Numerical examples	355

10.10	Concluding remarks	359
	References	360
11.	Non-linear structural problems – large displacement and instability	365
11.1	Introduction	365
11.2	Large displacement theory of beams	365
11.3	Elastic stability – energy interpretation	373
11.4	Large displacement theory of thick plates	375
11.5	Large displacement theory of thin plates	381
11.6	Solution of large deflection problems	383
11.7	Shells	386
11.8	Concluding remarks	391
	References	392
12.	Pseudo-rigid and rigid–flexible bodies	396
12.1	Introduction	396
12.2	Pseudo-rigid motions	396
12.3	Rigid motions	398
12.4	Connecting a rigid body to a flexible body	402
12.5	Multibody coupling by joints	404
12.6	Numerical examples	409
	References	410
13.	Computer procedures for finite element analysis	413
13.1	Introduction	413
13.2	Description of additional program features	414
13.3	Solution of non-linear problems	415
13.4	Restart option	428
13.5	Solution of example problems	429
13.6	Concluding remarks	430
	References	430
Appendix A:	Invariants of second-order tensors	432
A.1	Principal invariants	432
A.2	Moment invariants	433
A.3	Derivatives of invariants	434
