Foreword	xiii
Part I An Introduction to Musculotendon Modeling and Analysis	
1. OVERVIEW OF DYNAMIC MUSCULOSKELETAL MODELING	3
1.1 Introduction	3
1.2 Overview	5
1.3 Kane's Method Versus the Newton-Euler Approach	8
1.3.1 Example: Derivations of the Equations of Motion for a Two-Link Planar Linkage	10
1.3.1.1 Kane's Method	14
1.3.1.2 Newton-Euler Method	17
1.4 Dynamic Musculoskeletal Models and Modeling	20
1.5 Exercises	21
2. AN INTRODUCTION TO MODELING MUSCLE AND TENDON	23
2.1 Macroscopic Properties of Muscle	25
2.1.1 Twitch, Tetanus	26
2.1.2 Recruitment and Activation	28
2.1.3 He-Zajac-Levine Bilinear Activation Model	30
2.1.3.1 Examples	32
2.1.4 Force-Length Property	36
2.1.5 Force-Velocity Property	40
2.1.5.1 Activation scaling and normalization	40
2.2 Mathematical Models of Muscle	42
2.2.1 Basic Mechanical Elements of a Muscle Model	42
2.2.2 Series and Parallel Arrangements of Passive Elements	44
2.2.2.1 Maxwell Model	45
2.2.2.2 Voight model	49
2.2.2.3 Kelvin Model	51
2.2.3 Hill Muscle Model	51

2.3	Modeling Tendon Properties	53
2.4	The Musculotendon Actuator	55
2.5	Summary	64
2.6	Exercises	65
 Part II Defining Skeletal Kinematics		
3.	RIGID BODIES AND REFERENCE FRAMES	75
3.1	Generalized Coordinates	75
3.1.1	Single Rigid Bodies in the Plane and in Cartesian Space	76
3.1.2	Example – The Four-Bar Linkage	78
3.2	Vectors and Scalars	80
3.2.1	Notation	82
3.3	Rigid Bodies, Reference Frames, and Basis Vectors	83
3.4	Direction Cosines	84
3.4.1	Direction Cosines in Planar Motions	87
3.4.2	Direction Cosines in 3-D	88
3.5	Rotation Matrices	90
3.5.1	Properties of Rotation Matrices	91
3.5.2	Euler Angles and Other Rotation Sets	92
3.6	Transformation of Coordinates	95
3.7	Exercises	100
4.	VECTOR BASED KINEMATICS	103
4.1	Vector Computations	103
4.1.1	The Vector Dot Product	103
4.1.1.1	Example – Potential energy of a system having three links	105
4.1.2	The Vector Cross Product	106
4.1.3	Moment of a Vector	107
4.1.4	Moment of Force, Torque	108
4.1.4.1	Example – Torque exerted on a rigid body by a muscle contraction	109
4.1.4.2	Example – Muscle moment required to hold the pelvis static in a gravitational field	110
4.1.5	Direct Time Differentiation of a Vector	113
4.1.5.1	Example – Direct time differentiation of a vector	113
4.1.6	Velocity and Acceleration by Time Differentiation	115
4.2	Angular Velocity and Angular Acceleration	115
4.2.1	Angular Velocity	115
4.2.2	Addition Theorem for Angular Velocities	116
4.2.3	Angular Acceleration	117
4.3	Vector Calculus via Cross Products	118
4.3.1	Differentiation of a Vector Using Angular Velocity Vectors	118

4.3.1.1	Example – Differentiation of a vector fixed in B by a vector cross product	120
4.3.2	Differentiation in Two Reference Frames	121
4.3.2.1	Example – Differentiating a vector the easy way	122
4.3.2.2	Example – Differentiation of angular velocity vectors	123
4.3.2.3	Example – Velocity of a muscle	123
4.3.3	Velocity and Acceleration of Two Points on a Rigid Body	124
4.3.3.1	Example – An n -link planar kinematic chain	127
4.3.3.2	Example – Velocity and acceleration of the foot during a kick	129
4.3.4	Velocity and Acceleration of One Point Moving on a Rigid Body	130
4.3.4.1	Example – Computing velocities when there is a rolling point of contact under the foot	132
4.4	Example – Kinematics of a 7-DOF Arm Model	133
4.5	Exercises	140
5.	MODELS OF THE SKELETAL SYSTEM	143
5.1	Equivalence and Replacement	143
5.2	Segmental Mass, Product of Inertia, and Moment of Inertia	144
5.2.1	Inertia Tensor	146
5.3	Linked Segment Models	147
5.3.1	“Soft”, versus “Hard” Constraints	147
5.4	Single and Multiple Degree of Freedom Joints	149
5.4.1	Instantaneous Center of Rotation	150
5.4.2	The Moment Produced by a Spanning Force	154
5.4.3	Effective Origin and Insertion Points	156
5.4.4	Relationship of Moment Arm and Muscle Excursion	158
5.5	Passive Constraints at the Joints	160
5.5.1	Knee Joint Extension	162
5.6	Exercises	167
Part III	Dynamic Equations of Motion	
6.	DYNAMIC EQUATIONS OF MOTION	173
6.1	Generalized Speeds and Motion Constraints	173
6.2	Partial Velocity Vectors	174
6.2.1	Example – Partial velocities for an elastic pendulum	176
6.3	Generalized Active Forces	178
6.4	Generalized Inertia Forces	178
6.5	Dynamic Equations of Motion	179
6.5.1	Example – Equations of motion for a ball moving down an inclined plane	180

6.6	Further Description of the Matrices Which Form the Dynamic Equations of Motion	184
6.6.1	Mass matrix: M	184
6.6.2	Acceleration vector: $\vec{Q}$	184
6.6.3	Vector of moments from centrifugal forces: $\vec{V}$	184
6.6.4	Vector of moments from gravitational forces: $\vec{G}$	184
6.6.5	Vector of moments from external forces and torques: $\vec{E}$	185
6.6.6	Vector of applied torques: $\vec{T}$	185
6.7	Example – Segmental Torque Contributions for Uniarticular, Biarticular, and Multiarticular Muscles	186
6.7.1	Case I – Uniarticular muscle	186
6.7.2	Case II – Biarticular muscle	188
6.7.3	Case III – Multiarticular muscle	188
6.8	Contributing and Non-Contributing Forces and Torques	189
6.8.1	Contributing forces	190
6.8.2	Noncontributing forces	192
6.9	Joint Reaction Forces	196
6.9.1	Example – Humeroradial Joint Reaction Force	196
6.10	Gordon's Method	200
6.10.1	Example – Dynamic equations for a four-link planar linkage	202
6.11	Exercises	205
7.	CONTROL	207
7.1	Inverse and Forward Dynamics	207
7.1.1	Example – Cubic spline interpolation of generalized coordinates	209
7.2	Muscle Force Distribution	213
7.3	Alternative Optimization Methods	214
7.4	Forward Dynamic Simulation	220
7.5	Pseudoinverse Method	222
7.5.1	The Crowninshield-Brand Cost Function	223
7.5.2	Muscle Induced Accelerations	224
7.5.3	Properties of the Pseudoinverse	225
7.5.4	The Pseudoinverse Algorithm	226
7.6	Summary	231
7.7	Exercises	232
	Appendix A– Human Lower Extremity Segmental Parameters	239
	Chapter References	241
	Appendix B– Human Lower Extremity Muscle Parameters	243
	Chapter References	245
	About the Author	251
