Contents

Preface *page* vii
Nomenclature xii

1 Introduction 1
1.1 The fact of turbulent flow 1
1.2 Broad options in modelling 2
1.3 A preview of the mean-strain generation processes in the stress-transport equation 5
1.4 Some consequences of the no-slip boundary condition at a wall 9
1.5 Sequencing of the material 11

2 The exact equations 13
2.1 The underpinning conservation equations 13
2.2 The Reynolds equations 15
2.3 The second-moment equations 23

3 Characterization of stress and flux dynamics: elements required for modelling 33
3.1 Introduction 33
3.2 Energy flow processes in turbulence 33
3.3 The spectral character of turbulence 38
3.4 The ε-equation 43
3.5 Transport equation for the mean-square scalar variance, $\overline{\theta^2}$ 46
3.6 Transport equation for dissipation of scalar variance, $\varepsilon_{\theta\theta}$ 49
3.7 Turbulence anisotropy, invariants and realizability 50

4 Approaches to closure 60
4.1 General remarks and basic guidelines 60
4.2 Pressure interactions, Φ_{ij} and $\Phi_{\theta j}$: the Poisson equation 63

4.3 The basic second-moment closure for high-Re_t flow regions 67
4.4 Pressure-strain models from tensor expansion 86
4.5 Turbulence affected by force fields 113
4.6 Modelling the triple moments 134

5 Modelling the scale-determining equations 143
5.1 The energy dissipation rate, ε 143
5.2 Other scale-determining equations 156
5.3 Multi-scale approaches 160
5.4 Determining $\varepsilon_{\theta\theta}$, the dissipation rate of $\overline{\theta^2}$ 167

6 Modelling in the immediate wall vicinity and at low Re_t 170
6.1 The nature of viscous and wall effects: options for modelling 170
6.2 The structure of the near-wall sublayer 173
6.3 Wall integration (WIN) schemes 188
6.4 Illustration of the performance of two near-wall models 214
6.5 Elliptic relaxation concept 229

7 Simplified schemes 240
7.1 Rationale and organization 240
7.2 Reduced transport-equation models 241
7.3 Algebraic truncations of the second-moment equations 247
7.4 Linear eddy-viscosity models 270
7.5 The use of ASMs and linear EVMs within an unsteady RANS framework 301

8 Wall functions 313
8.1 Early proposals 313
8.2 Towards a generalization of the wall-function concept: preliminaries 319
8.3 Analytical wall functions (AWF): the Manchester scheme 322
8.4 A Simplified AWF (SAWF): the Delft scheme 331
8.5 Blended wall treatment (BWT) 335
8.6 Numerical wall functions (NWF) 341
