

TABLE OF CONTENTS

Preface		XIII
Introduction		XV
Notation		XXI
CHAPTER 1	THE ROLLING CONTACT PROBLEM	1
1.1	Statement of the problem	4
1.2	Mathematical modeling of the contact formation	6
1.3	Mathematical modeling of the slip	10
1.4	Mathematical modeling of friction	18
1.5	The complete boundary conditions	20
1.6	The half-space approximation	22
1.6.1	Many geometries are elastically alike	23
1.6.2	$A(x,y)$ may be calculated exactly	23
1.6.3	Quasiidentity is common in half-space problems	24
	1.6.3.1 The Panagiotopoulos process	24
	1.6.3.2 An Alternative to the Panagiotopoulos process (KOMBI)	24
	1.6.3.3 The Johnson process	25
	1.6.3.4 Symmetry and quasiidentity	25
	1.6.3.5 Mindlin's method	28
1.6.4	Exact three-dimensional solutions of contact problems	28
1.7	Boundary conditions for some applications	28
1.7.1	The Hertz problem	28
1.7.2	Frictionless or quasiidentical contact formation for concentrated or semi-concentrated non-Hertzian contact	35

1.7.3	Frictional boundary conditions for bodies of revolution with the axes almost in one plane	41
1.7.3.1	Concentrated, e.g. Hertzian, geometry	44
1.7.3.2	A ball rolling in a conforming groove	45
CHAPTER 2 REVIEW		47
2.1	Frictionless contact	48
2.1.1	Element methods	49
2.1.1.1	Fridman and Chernina	50
2.1.1.2	Later authors	51
2.1.1.3	Influence Function Methods for the half-space: choice of elements	52
2.1.1.4	The accuracy of the elements	56
2.1.1.5	Conclusion	59
2.2	Elastic rolling contact	59
2.2.1	Carter and Fromm	59
2.2.2	The no-slip theory of rolling contact	64
2.2.2.1	Comparison of Johnson's spin theory with the exact values	66
2.2.2.2	Comparison of Vermeulen and Johnson's no-spin theory with the exact values	67
2.2.2.3	Calculation of the exact values of the C_{ij} by separating the variables in Laplace's equation	68
2.2.2.4	Calculation on the basis of a generalisation of Galin's Theorem	69
2.2.2.5	Strip theory/line contact theory	71
2.2.2.6	IF methods for the half-space	73
2.2.3	Nonlinear, finite friction rolling contact	74
2.2.3.1	Johnson and Vermeulen-Johnson	74
2.2.3.2	Strip theory	78
2.2.3.3	Simplified theory	80
2.2.3.4	The first exact theory	82
2.2.3.5	A linear programming method for the two-dimensional case	84
2.2.3.6	Generalisation of the method of Sec. 2.2.3.5 to the three-dimensional case	94
2.2.3.7	Duvaut-Lions based methods	95

CHAPTER 3	THE SIMPLIFIED THEORY OF CONTACT	99
3.1	Recapitulation of the linear theory of elasticity	100
3.2	The thin elastic layer	101
3.3	Validation by frictionless contact	103
3.3.1	Comparison with the theory of Meijers	103
3.3.2	Comparison with the Hertz theory	107
3.3.3	Conclusion	112
3.4	Frictional compression	112
3.5	The FASTSIM algorithm	117
3.6	The shift	119
3.6.1	$\psi = 0$, $w = (L_1, 0)^T$, elliptic contact	120
3.6.2	$\psi = L_1$, $w = 0$	122
3.7	Steady state rolling contact	122
3.7.1	The full adhesion solution	123
3.7.2	Finite friction coefficient	126
3.8	Transient rolling contact	133
3.9	An alternative method to find the L_i	133
3.10	Conclusion of tangential simplified theory	134
CHAPTER 4	VARIATIONAL AND NUMERICAL THEORY OF CONTACT	137
4.1	The principle of virtual work and its dual for contact problems	138
4.1.1	Virtual work	138
4.1.2	Complementary virtual work	144
4.2	Application to elasticity	148
4.2.1	Minimality of the potential energy, maximality of the complementary energy, and uniqueness of the solution	150
4.2.2	The case $\delta g \neq 0$	154
4.2.3	Existence-uniqueness theory	156
4.2.4	Surface mechanical principles	157
4.2.5	Complementary energy or potential energy in numerical work?	158
4.3	Implementation	159
4.3.1	The basic algorithm	160
4.3.2	Discretisation of the contact problem	168
4.3.3	The algorithm of 4.3.1 applied to half-space contact problems	172
4.3.4	Steady state rolling, elastic and viscoelastic	181
4.3.5	Prescription of total force components	181

4.3.6	Sensitivities	182
4.3.7	Calculation of the influence numbers in a half-space	183
4.3.8	The subsurface elastic field in a half-space	184
4.3.9	Note on the generalisation to non-concentrated contacts	184
CHAPTER 5	RESULTS	185
5.1	The normal contact problem	186
5.1.1	Validation (normal contact)	188
5.1.2	New results achieved by RNJLK and CC	193
5.2	Quasiidentical frictional contact problems	202
5.2.1	Validation	203
5.2.1.1	The Cattaneo shift	203
5.2.1.2	The Mindlin shift	205
5.2.1.3	The creepage and spin coefficients for steady state rolling	206
5.2.1.4	The theory of Vermeulen-Johnson on steady state rolling and its generalisations	207
5.2.1.5	The Vermeulen-Johnson theory and its generalisations: Validation	213
5.2.1.6	Brickle's experiments compared with CONTACT and FASTSIM	214
5.2.2	New results in Hertzian frictional rolling contact	215
5.2.2.1	The total tangential force	216
5.2.2.2	The areas of adhesion and slip	218
5.2.2.3	Surface tractions	219
5.2.2.4	Subsurface stresses	221
5.2.2.5	Transient rolling contact	224
5.2.2.6	Some remarks on corrugation	229
5.3	Non-quasiidentical frictional contact problems	231
5.3.1	Validation	231
5.3.2	New results	233
5.3.2.1	Unloading the Spence compression	233
5.3.2.2	Transition from the Spence compression to steady state rolling	235
CHAPTER 6	CONCLUSION	237

Appendix A	The basic equations of the linear theory of elasticity	239
Appendix B	Some notions of mathematical programming	245
Appendix C	Numerical calculation of the elastic field in a half-space	255
Appendix D	Three-dimensional viscoelastic bodies in steady state frictional rolling contact with generalisation to contact perturbations	265
Appendix E	Tables	285
