Preface	xi
1 From CAD and FEA to Isogeometric Analysis: An Historical Perspective	1
1.1 Introduction	1
1.1.1 <i>The need for isogeometric analysis</i>	1
1.1.2 <i>Computational geometry</i>	7
1.2 The evolution of FEA basis functions	8
1.3 The evolution of CAD representations	12
1.4 Things you need to get used to in order to understand NURBS-based isogeometric analysis	16
Notes	18
2 NURBS as a Pre-analysis Tool: Geometric Design and Mesh Generation	19
2.1 B-splines	19
2.1.1 <i>Knot vectors</i>	19
2.1.2 <i>Basis functions</i>	21
2.1.3 <i>B-spline geometries</i>	28
2.1.4 <i>Refinement</i>	36
2.2 Non-Uniform Rational B-Splines	47
2.2.1 <i>The geometric point of view</i>	47
2.2.2 <i>The algebraic point of view</i>	50
2.3 Multiple patches	52
2.4 Generating a NURBS mesh: a tutorial	54
2.4.1 <i>Preliminary considerations</i>	56
2.4.2 <i>Selection of polynomial orders</i>	59
2.4.3 <i>Selection of knot vectors</i>	60
2.4.4 <i>Selection of control points</i>	61
2.5 Notation	65
Appendix 2.A: Data for the bent pipe	66
Notes	68
3 NURBS as a Basis for Analysis: Linear Problems	69
3.1 The isoparametric concept	69
3.1.1 <i>Defining functions on the domain</i>	71
3.2 Boundary value problems (BVPs)	72

3.3	Numerical methods	72
3.3.1	<i>Galerkin</i>	73
3.3.2	<i>Collocation</i>	78
3.3.3	<i>Least-squares</i>	81
3.3.4	<i>Meshless methods</i>	83
3.4	Boundary conditions	84
3.4.1	<i>Dirichlet boundary conditions</i>	84
3.4.2	<i>Neumann boundary conditions</i>	86
3.4.3	<i>Robin boundary conditions</i>	86
3.5	Multiple patches revisited	87
3.5.1	<i>Local refinement</i>	87
3.5.2	<i>Arbitrary topologies</i>	91
3.6	Comparing isogeometric analysis with classical finite element analysis	92
3.6.1	<i>Code architecture</i>	94
3.6.2	<i>Similarities and differences</i>	97
	Appendix 3.A: Shape function routine	97
	Appendix 3.B: Error estimates	103
	Notes	106
4	Linear Elasticity	109
4.1	Formulating the equations of elastostatics	110
4.1.1	<i>Strong form</i>	111
4.1.2	<i>Weak form</i>	111
4.1.3	<i>Galerkin's method</i>	112
4.1.4	<i>Assembly</i>	113
4.2	Infinite plate with circular hole under constant in-plane tension	116
4.3	Thin-walled structures modeled as solids	120
4.3.1	<i>Thin cylindrical shell with fixed ends subjected to constant internal pressure</i>	120
4.3.2	<i>The shell obstacle course</i>	123
4.3.3	<i>Hyperboloidal shell</i>	131
4.3.4	<i>Hemispherical shell with a stiffener</i>	136
	Appendix 4.A: Geometrical data for the hemispherical shell	142
	Appendix 4.B: Geometrical data for a cylindrical pipe	142
	Appendix 4.C: Element assembly routine	144
	Notes	147
5	Vibrations and Wave Propagation	149
5.1	Longitudinal vibrations of an elastic rod	149
5.1.1	<i>Formulating the problem</i>	149
5.1.2	<i>Results: NURBS vs. FEA</i>	151
5.1.3	<i>Analytically computing the discrete spectrum</i>	155
5.1.4	<i>Lumped mass approaches</i>	159
5.2	Rotation-free analysis of the transverse vibrations of a Bernoulli–Euler beam	164
5.3	Transverse vibrations of an elastic membrane	165
5.3.1	<i>Linear and nonlinear parameterizations revisited</i>	166
5.3.2	<i>Formulation and results</i>	166

5.4	Rotation-free analysis of the transverse vibrations of a Poisson–Kirchhoff plate	168
5.5	Vibrations of a clamped thin circular plate using three-dimensional solid elements	169
5.5.1	<i>Formulating the problem</i>	170
5.5.2	<i>Results</i>	172
5.6	The NASA aluminum testbed cylinder	172
5.7	Wave propagation	173
5.7.1	<i>Dispersion analysis</i>	178
5.7.2	<i>Duality principle</i>	179
	Appendix 5.A: Kolmogorov n -widths	180
	Notes	184
6	Time-Dependent Problems	185
6.1	Elastodynamics	185
6.2	Semi-discrete methods	186
6.2.1	<i>Matrix formulation</i>	186
6.2.2	<i>Viscous damping</i>	187
6.2.3	<i>Predictor/multicorrector Newmark algorithms</i>	188
6.3	Space–time finite elements	191
7	Nonlinear Isogeometric Analysis	197
7.1	The Newton–Raphson method	197
7.2	Isogeometric analysis of nonlinear differential equations	198
7.2.1	<i>Nonlinear heat conduction</i>	198
7.2.2	<i>Applying the Newton–Raphson method</i>	199
7.2.3	<i>Nonlinear finite element analysis</i>	200
7.3	Nonlinear time integration: The generalized- α method	202
	Note	209
8	Nearly Incompressible Solids	211
8.1	$\bar{B}$ formulation for linear elasticity using NURBS	212
8.1.1	<i>An intuitive look at mesh locking</i>	213
8.1.2	<i>Strain projection and the $\bar{B}$ method</i>	215
8.1.3	<i>$\bar{B}$, the projection operator, and NURBS</i>	216
8.1.4	<i>Infinite plate with circular hole under in-plane tension</i>	220
8.2	$\bar{F}$ formulation for nonlinear elasticity	221
8.2.1	<i>Constitutive equations</i>	221
8.2.2	<i>Pinched torus</i>	222
	Notes	225
9	Fluids	227
9.1	Dispersion analysis	227
9.1.1	<i>Pure advection: the first-order wave equation</i>	227
9.1.2	<i>Pure diffusion: the heat equation</i>	230
9.2	The variational multiscale (VMS) method	231
9.2.1	<i>Numerical example: linear advection–diffusion</i>	232
9.2.2	<i>The Green’s operator</i>	233

9.2.3	<i>A multiscale decomposition</i>	235
9.2.4	<i>The variational multiscale formulation</i>	237
9.2.5	<i>Reconciling Galerkin's method with VMS</i>	238
9.3	<i>Advection–diffusion equation</i>	239
9.3.1	<i>Formulating the problem</i>	240
9.3.2	<i>The streamline upwind/Petrov–Galerkin (SUPG) method</i>	240
9.3.3	<i>Numerical example: advection–diffusion in two dimensions, revisited</i>	241
9.4	<i>Turbulence</i>	243
9.4.1	<i>Incompressible Navier–Stokes equations</i>	245
9.4.2	<i>Multiscale residual-based formulation of the incompressible Navier–Stokes equations employing the advective form</i>	246
9.4.3	<i>Turbulent channel flow</i>	248
	<i>Notes</i>	251
10	Fluid–Structure Interaction and Fluids on Moving Domains	253
10.1	<i>The arbitrary Lagrangian–Eulerian (ALE) formulation</i>	253
10.2	<i>Inflation of a balloon</i>	254
10.3	<i>Flow in a patient-specific abdominal aorta with aneurysm</i>	256
10.3.1	<i>Construction of the arterial cross-section</i>	256
10.3.2	<i>Numerical results</i>	261
10.4	<i>Rotating components</i>	264
10.4.1	<i>Coupling of the rotating and stationary domains</i>	266
10.4.2	<i>Numerical example: two propellers spinning in opposite directions</i>	272
	<i>Appendix 10.A: A geometrical template for arterial blood flow modeling</i>	275
11	Higher-order Partial Differential Equations	279
11.1	<i>The Cahn–Hilliard equation</i>	279
11.1.1	<i>The strong form</i>	280
11.1.2	<i>The dimensionless strong form</i>	281
11.1.3	<i>The weak form</i>	281
11.2	<i>Numerical results</i>	282
11.2.1	<i>A two-dimensional example</i>	282
11.2.2	<i>A three-dimensional example</i>	282
11.3	<i>The continuous/discontinuous Galerkin (CDG) method</i>	283
	<i>Note</i>	285
12	Some Additional Geometry	287
12.1	<i>The polar form of polynomials</i>	287
12.1.1	<i>Bézier curves and the de Casteljau algorithm</i>	288
12.1.2	<i>Continuity of piecewise curves</i>	291
12.2	<i>The polar form of B-splines</i>	293
12.2.1	<i>Knot vectors and control points</i>	293
12.2.2	<i>Knot insertion and the de Boor algorithm</i>	295
12.2.3	<i>Bézier decomposition and function subdivision</i>	297
	<i>Note</i>	301

13	State-of-the-Art and Future Directions	303
13.1	State-of-the-art	303
13.2	Future directions	305
Appendix A: Connectivity Arrays		313
A.1	The INC Array	313
A.2	The IEN array	315
A.3	The ID array	318
	<i>A.3.1 The scalar case</i>	318
	<i>A.3.2 The vector case</i>	318
A.4	The LM array	319
	Note	321
