

Contents

Chapter 1	Introduction.....	1
1.1	Background and Review	1
1.2	Fundamentals of Dynamics	3
1.2.1	Frequency-independent and frequency-dependent stiffness	3
1.2.2	Viscous damping and linear hysteretic damping.....	4
1.2.3	Vibration under external force	8
1.2.4	Vibration under base acceleration	9
1.2.5	Time series analysis	12
1.3	Conventional Techniques for System Identification	15
1.4	Organization of this Book	16
	References	18
Chapter 2	Stiffness-damping Simultaneous Identification Using Limited Earthquake Records	21
2.1	Introduction.....	21
2.2	Stiffness-damping Simultaneous Identification: Theory.....	23
2.2.1	Identification system	23
2.2.2	Identification of stiffness and linear hysteretic (material) damping	24
2.2.3	Identification of viscous damping	28
2.3	Verification of Theory Through Numerical Simulation Models.....	29
2.3.1	Numerical simulation model	29
2.3.2	Identification of stiffness.....	30
2.3.3	Identification of linear hysteretic damping.....	32
2.3.4	Identification of viscous damping	32
2.4	Verification of Theory Through Actual Limited Earthquake Records	34
2.4.1	Earthquake records in a base-isolated building	34
2.4.2	Identification of stiffness.....	35
2.4.3	Identification of damping	38
2.5	Identification of Maxwell-type Models.....	39
2.6	Summaries.....	43
	References	43

Chapter 3	System Identification Using One-dimensional Shear Beam Finite-element Models and Limited Earthquake Records	47
3.1	Introduction	47
3.2	One-dimensional Shear Beam Subjected to Horizontal Earthquake Ground Motion.....	48
3.2.1	Case of viscous damping.....	48
3.2.2	Case of linear hysteretic damping	50
3.3	Relation of Fourier Transformed Recorded Ground Motion with Model Properties	51
3.4	Identification of Stiffness and Linear Hysteretic (Material) Damping.....	53
3.5	Identification by Use of Recorded Ground Motion Data	55
3.5.1	Identification based on records just below engineering bedrock	58
3.5.2	Identification based on dense records.....	60
3.6	Summaries.....	60
	References	64
Chapter 4	Temporal Variation of Modal Properties of a Base-isolated Building During an Earthquake.....	67
4.1	Introduction	67
4.2	System Identification Method	68
4.3	Observation of Earthquake Records in Base-isolated Building	70
4.4	Result of Modal-parameter System Identification	74
4.5	Summaries.....	82
	References	82
Chapter 5	Stiffness-damping Simultaneous Identification Under Limited Observation with Noise: Preliminary Approach	85
5.1	Introduction.....	85
5.2	Stiffness-damping Simultaneous Identification: Theory	86
5.2.1	Identification system	86
5.2.2	Identification of stiffness and linear hysteretic damping	88
5.2.3	Identification of viscous damping	89
5.3	Extension to Stationary Random Vibration.....	89
5.4	Noise Elimination and Reduction	91
5.4.1	Noise elimination and reduction (1).....	91
5.4.2	Noise elimination and reduction (2).....	93
5.5	Verification of Theory Through Numerical Simulation Models	94
5.5.1	Numerical simulation model	94
5.5.2	Identification of stiffness.....	95

5.5.3	Identification of linear hysteretic damping ratio and viscous damping coefficient.....	97
5.6	Verification of Theory Through Actual Limited Records.....	99
5.6.1	Actual record in base-isolated building as approximate stationary random process.....	99
5.6.2	Identification of stiffness.....	100
5.6.3	Identification of damping.....	101
5.7	Validity of Limit Manipulation at Zero Frequency.....	103
5.8	Summaries.....	105
	References	106

Chapter 6 Noise Effect in Physical-parameter System

	Identification Under Stationary Random Input.....	109
6.1	Introduction.....	109
6.2	Stiffness-damping Simultaneous Identification	110
6.2.1	Identification of stiffness and linear hysteretic (material) damping.....	110
6.2.2	Application of smart identification technique to stationary random vibration	113
6.3	Effect of Noise Level and Correlation on Identification.....	114
6.3.1	Formulation under noisy environment	114
6.3.2	Modeling of noise considering correlation between noises	116
6.3.3	Theoretical analysis of effect of noise level and correlation on identification.....	117
6.3.4	Numerical simulation method in frequency domain	118
6.3.5	Numerical examination	120
6.4	Summaries.....	127
	References	128

Chapter 7 Noise-bias Compensation Method (I)

	for Small-amplitude Stationary Random Input	131
7.1	Introduction.....	131
7.2	Stiffness-damping Simultaneous Identification Under Stationary Input.....	131
7.3	Noise-bias Compensation Method (I) Based on Prediction of Noise Levels and their Coherency.....	134
7.3.1	Modeling of noise considering correlation between noises	135
7.3.2	Prediction of noise levels and their coherency	136
7.3.3	Noise-bias compensation method.....	137
7.3.4	Numerical example (2-story model).....	138
7.3.5	Numerical example (5-story model).....	142
7.4	Summaries.....	144
	References	144

Chapter 8	Noise-bias Compensation Method (II) for Small-amplitude Stationary Random Input	147
8.1	Introduction	147
8.2	Stiffness-damping Simultaneous Identification Under Stationary Input	147
8.3	Effect of Noise on Identification	150
8.3.1	Formulation under noisy environment	150
8.3.2	Numerical examination	153
8.4	Noise-bias Elimination Method (II) based on Prediction of Noise Levels without Limit Manipulation	156
8.4.1	Method for estimation of the level of noises and compensation of the effect of noises without limit manipulation	156
8.4.2	Numerical example using the proposed noise-bias compensation method	159
8.4.3	Example using actual microtremor records	162
8.5	Summaries	166
	References	167

Chapter 9	Stiffness-damping Simultaneous Identification of Buildings Including Unknown Inner Vibration Source	169
9.1	Introduction	169
9.2	Stiffness-damping Identification Under Unknown Input	170
9.2.1	Stiffness-damping identification using response under ground-motion input	170
9.2.2	Stiffness-damping identification using response under unknown inner vibration source	172
9.3	System Identification Including Unknown Inner Vibration Source	174
9.3.1	Overview of the proposed method	174
9.3.2	System identification in case of unknown stiffnesses and damping coefficients	176
9.3.3	Physical interpretation of system identification using limit at zero frequency	182
9.4	Numerical Examples	184
9.4.1	Prediction of fundamental natural frequency and the lowest-mode damping ratio	184
9.4.2	Prediction of position of inner load	185
9.4.3	Stiffnesses and damping coefficients at upper stories	185
9.4.4	Stiffness ratios in the lower stories	186
9.4.5	Stiffness level in the lower stories	186
9.4.6	Damping coefficient ratios in the lower stories	187
9.4.7	Damping coefficient level in the lower stories	188
9.5	Application to Test Structures	189
9.6	Improved Identification Method based on ARX Model	193

9.6.1	Modeling of transfer function.....	193
9.6.2	Outline of new noise compensation method	193
9.6.3	High-pass filtering.....	193
9.6.4	Optimal cutting frequency.....	195
9.6.5	Numerical example using improved identification method	195
9.7	Summaries.....	197
	References	198

Chapter 10 Stiffness-damping Simultaneous Identification Based on Extrapolation of Unrecorded Response to Ground Motion .. 199

10.1	Introduction.....	199
10.2	Identification Method Using Limit Manipulation	200
10.2.1	Identification of stiffness and damping coefficient	200
10.2.2	Uniqueness of identification of structural parameters including unrecorded story	202
10.3	Identification Method Based on Extrapolation of Unrecorded Data (Method 1)	206
10.3.1	Extrapolation of unrecorded data	206
10.3.2	Identification method using extrapolated data.....	207
10.3.3	Numerical examples.....	208
10.4	Identification Method Based on Direct Estimation of Physical Parameters (Method 2).....	213
10.4.1	Identification method without limit manipulation.....	213
10.4.2	Numerical examples.....	215
10.5	Summaries.....	218
	References	219

Chapter 11 Stiffness-damping Identification of Buildings Using Limited Earthquake Records and ARX Model..... 221

11.1	Introduction.....	221
11.2	Identification of Stiffness and Damping Coefficient Using Limit Manipulation.....	221
11.3	Identification of Stiffness and Damping Coefficient Using ARX Model	224
11.3.1	Summary of procedure	224
11.3.2	Taylor series expansion of transfer function	224
11.3.3	Relation of the limit value of transfer function with ARX parameters.....	226
11.3.4	ARX parameter expression of identification function.....	228
11.3.5	ARX parameter estimation with constraints.....	228
11.4	Numerical Examples	229
11.4.1	Numerical simulation model	229
11.4.2	Transfer function in terms of ARX parameters	229
11.4.3	Order of ARX model.....	232

11.4.4 Identification of stiffness.....	233
11.4.5 Identification of damping.....	234
11.5 Application of the Method to Actual Recorded Data for Miniature Model Structures	235
11.5.1 One-story model.....	235
11.5.2 Four-story model.....	235
11.6 Application of the Method to Actual Base-isolated Building	236
11.7 Summary	240
Appendix 1 ARX Model (Adachi 2009).....	241
Appendix 2 ARX Parameter Expression of Transfer Function	241
Appendix 3 Prediction Error in ARX Model.....	241
Appendix 4 Least-mean-square Estimate of Parameter Vector	242
References	242

Concluding Remarks: Future Directions..... 245

1. Introduction.....	245
2. Identification of Hysteretic Restoring-force Characteristics.....	245
3. Identification Under Noisy Environment (Low S/N Ratio).....	245
4. Identification Under Small-level Vibration	246
5. Validation of Theories Using Actual Recorded Data	246
6. New Measurement System	246
7. Summary.....	247
References	247
