|------------------------------------------------------------------------------------------------|-----------|
| <b>Foreword of the Editor</b>                                                                  | <b>ix</b> |
| <b>1 Simple questions and answers</b>                                                          | <b>1</b>  |
| 1.1 What is a constitutive equation? . . . . .                                                 | 1         |
| 1.2 What for is a constitutive equation useful? . . . . .                                      | 1         |
| 1.3 What is elasticity? . . . . .                                                              | 2         |
| 1.4 Why is the theory of elasticity inappropriate to describe the behaviour of soil? . . . . . | 2         |
| 1.5 How can we describe anelastic (i.e. irreversible) deformations? . . .                      | 2         |
| 1.6 What is elastoplasticity? . . . . .                                                        | 3         |
| 1.7 What is hypoplasticity? . . . . .                                                          | 3         |
| 1.8 What are the advantages of hypoplasticity? . . . . .                                       | 3         |
| 1.9 What does the hypoplastic constitutive equation? . . . . .                                 | 4         |
| 1.10 Why are there several versions of hypoplastic equations? . . . . .                        | 4         |
| 1.11 What is the range of validity of hypoplasticity? . . . . .                                | 4         |
| <b>2 Experimental results on soil behaviour</b>                                                | <b>6</b>  |
| 2.1 Triaxial test . . . . .                                                                    | 6         |
| 2.1.1 Barotropy and pyknotropy . . . . .                                                       | 7         |
| 2.1.2 Critical state . . . . .                                                                 | 10        |
| 2.1.3 Unloading . . . . .                                                                      | 11        |
| 2.1.4 Homogeneity of deformation . . . . .                                                     | 11        |

|          |                                                  |           |
|----------|--------------------------------------------------|-----------|
| 2.1.5    | Behaviour of undrained samples . . . . .         | 12        |
| 2.1.6    | The true triaxial test . . . . .                 | 14        |
| 2.2      | Oedometric test . . . . .                        | 15        |
| <b>3</b> | <b>Fundamentals of Continuum Mechanics</b>       | <b>17</b> |
| 3.1      | Deformation . . . . .                            | 17        |
| 3.2      | Stretching . . . . .                             | 17        |
| 3.3      | Simple shear . . . . .                           | 18        |
| 3.4      | Cauchy stress . . . . .                          | 20        |
| 3.5      | Change in observer . . . . .                     | 22        |
| 3.6      | Objectivity, objective time rates . . . . .      | 25        |
| 3.7      | General constitutive equation . . . . .          | 27        |
| 3.8      | Principle of macrodeterminism . . . . .          | 27        |
| 3.9      | Internal constraints . . . . .                   | 28        |
| 3.10     | Effective stress . . . . .                       | 29        |
| 3.11     | Isotropy groups . . . . .                        | 30        |
| 3.12     | Rate dependence . . . . .                        | 31        |
| <b>4</b> | <b>Hypoplasticity</b>                            | <b>33</b> |
| 4.1      | Rate equations . . . . .                         | 33        |
| 4.2      | Incremental non-linearity . . . . .              | 34        |
| 4.3      | Homogeneity in stress . . . . .                  | 35        |
| 4.4      | Hypoelasticity . . . . .                         | 36        |
| 4.5      | Elastoplasticity . . . . .                       | 36        |
| 4.6      | Hypoplasticity . . . . .                         | 38        |
| 4.7      | Response envelopes . . . . .                     | 41        |
| 4.8      | Numerical simulation of element tests . . . . .  | 42        |
| 4.9      | Calibration . . . . .                            | 44        |
| 4.10     | Dilatancy and pore pressure . . . . .            | 46        |
| 4.11     | Cyclic loading, ratcheting, shake-down . . . . . | 47        |

|                                                                |           |
