Abstract	8
Symbols	10
1 Current expertise in the field and genesis of the problem	12
1.1. The purpose of this work and the main thesis	23
1.2. The scope of the study	23
2 Morphology of solid phase particles	25
2.1. Categories of solid phase particles	25
2.2. Characteristic dimensions	26
2.3. Equivalent dimensions	28
2.4. Grain shape	30
2.5. Summing-up	34
3 Non-grain suspensions	35
3.1. Origins	35
3.2. Aggregate structure	38
3.3. Relationships between characteristic radii in aggregates .	40
3.4. Particle porosity in non-grain suspensions	42
3.5. Permeability	46
3.6. Summing-up	52
4 Fractal structure of particles in non-grain suspensions	53
4.1. Fractal dimension	54
4.1.1 Topological dimension	55
4.1.2 Self-similarity dimension	55
4.1.3 Box counting dimension	55
4.1.4 Compass dimension	57
4.1.5 Information dimension	57
4.1.6 Correlation dimension	58
4.2. Fractal dimensions of solid particles in non-grain suspensions	59
4.3. Summing-up	62
5 Falling of particle in fluids	63
5.1. Balance of forces acting upon particles	63
5.2. Stokes' law	65
5.3. Corrections of the Stokes equation	66

5.4.	Particle in a suspension as a fractal	68
5.5.	Summing-up	72
6	The role of turbidity indicators in determining the quality of the products of sedimentation	73
6.1.	Turbidity of suspensions	73
6.2.	Turbidity measurements	74
6.3.	Light scattering on small-size solid particles	75
6.4.	Turbidimetric and nephelometric turbidity	80
6.5.	Summing-up	83
7	Testing of grain size distribution in selected non-grain suspensions	84
7.1.	The influence of the coagulant dose on grain size distribution in non-grain suspensions	85
7.1.1	Experimental set-up	86
7.1.2	Interpretation of readouts	86
7.1.3	Materials	89
7.1.4	Methodology	90
7.1.5	Results	90
7.1.6	Conclusions	90
7.2.	Summing-up	92
8	Laboratory testing of structure of selected non-grain suspensions	94
8.1.	Materials	95
8.1.1	Density measurement	96
8.1.2	Grain size distribution	96
8.1.3	Identification of mineralogical composition	101
8.2.	Studies of the structure of coagulated suspensions	108
8.2.1	Particle structure in the suspension GTDB	112
8.2.2	The influence of hydrodynamic conditions on the particle structure in non-grain suspensions	124
8.3.	Summing-up	135
9	Laboratory testing of sedimentation processes in non-grain suspensions	136
9.1.	Turbidity tests of suspensions with different concentrations	136
9.2.	Multiflux sedimentation tests	143
9.2.1	Test facility	144
9.2.2	Measurement methodology	146

9.2.3 Results	147
9.3. Conclusions	159
10 The application of multiflux sedimentation to clarification of non-grain suspensions from water treatment plants	159
10.1. The characteristics of water to be treated	160
10.2. Sedimentation tests in laboratory conditions	162
10.2.1 Grain-size distribution tests	163
10.2.2 Testing under the flow conditions	166
10.3. The extent of tank filling with the multiflux packets . . .	169
10.4. Performance tests of the settling tank in the Water Treat- ment Plant	170
10.4.1 Performance of the post-coagulation installation .	171
10.4.2 Testing the particle structure in sedimenting sus- pensions	173
10.5. Conclusions	177
11 Modelling of sedimentation of non-grain suspensions	178
11.1. Performance indicators of sedimentation installations . .	179
11.2. Kowalski's model (traditional)	180
11.3. The extended model of sedimentation of non-grain suspen- sions	183
11.4. Verification of models	185
11.5. Summary	192
12 Summary and conclusions	193
