|                                                                                                                |     |
|----------------------------------------------------------------------------------------------------------------|-----|
| Introduction . . . . .                                                                                         | VII |
| Guidelines for the Reader. Abbreviations . . . . .                                                             | X   |
| <br><b>I INTRODUCTORY TOPICS</b>                                                                               |     |
| 1 Elements of Nonsmooth Analysis . . . . .                                                                     | 3   |
| 1.1 Convexity and Subdifferential . . . . .                                                                    | 3   |
| 1.2 Generalized Gradient and Related Calculus . . . . .                                                        | 9   |
| 1.3 Minimization Problems. Duality of Convex Functionals . . . . .                                             | 18  |
| 1.4 Miscellanea: Fans, Quasidifferentials, Codifferentials . . . . .                                           | 24  |
| <br><b>II MECHANICAL THEORY</b>                                                                                |     |
| 2 Nonsmooth Mechanics I . . . . .                                                                              | 33  |
| 2.1 Convex Superpotentials . . . . .                                                                           | 33  |
| 2.2 Nonconvex Superpotentials . . . . .                                                                        | 41  |
| 2.3 Boundary Conditions Expressed via Convex Superpotentials . . . . .                                         | 44  |
| 2.4 Boundary Conditions Expressed via Nonconvex Superpotentials . . . . .                                      | 51  |
| 2.5 Extensions to Function Spaces . . . . .                                                                    | 58  |
| 3 Nonsmooth Mechanics II . . . . .                                                                             | 65  |
| 3.1 Material Laws Expressed via Convex Superpotentials. An Overview . . . . .                                  | 65  |
| 3.2 Material Laws Expressed via Nonconvex Superpotentials I . . . . .                                          | 72  |
| 3.3 Material Laws Expressed via Nonconvex Superpotentials II . . . . .                                         | 81  |
| 3.4 Loading and Unloading Problems. The Advantage of the Use of Superpotentials . . . . .                      | 88  |
| 3.5 Material Laws and Boundary Conditions Expressed via Fans, Quasidifferentials and Codifferentials . . . . . | 91  |

|     |                                                                                                                     |     |
|-----|---------------------------------------------------------------------------------------------------------------------|-----|
| 4   | Hemivariational Inequalities . . . . .                                                                              | 99  |
| 4.1 | The Derivation of Hemivariational Inequalities in Mechanical Problems . . . . .                                     | 99  |
| 4.2 | Hemivariational and Variational-Hemivariational Inequalities . .                                                    | 105 |
| 4.3 | Substationarity Problems for the Potential or the Complementary Energy . . . . .                                    | 116 |
| 4.4 | Loading and Unloading Problems, Eigenvalue Problems for Hemivariational Inequalities and Dynamic Problems . . . . . | 121 |
| 4.5 | On the F-superpotential and the V-superpotential. Quasidifferentiability in Mechanics . . . . .                     | 126 |
| 5   | Multivalued Boundary Integral Equations . . . . .                                                                   | 135 |
| 5.1 | The Indirect and the Direct Method for Nonmonotone Boundary Conditions . . . . .                                    | 135 |
| 5.2 | Complement for Adhesively Bonded Cracks . . . . .                                                                   | 143 |

**III    MATHEMATICAL THEORY**

|     |                                                                                                      |     |
|-----|------------------------------------------------------------------------------------------------------|-----|
| 6   | Static Hemivariational Inequalities . . . . .                                                        | 155 |
| 6.1 | Coercive Hemivariational Inequalities . . . . .                                                      | 155 |
| 6.2 | Semicoercive Hemivariational Inequalities . . . . .                                                  | 163 |
| 6.3 | On the Substationarity of the Energy . . . . .                                                       | 167 |
| 6.4 | Variational Hemivariational Inequalities . . . . .                                                   | 169 |
| 6.5 | Applications to Engineering Problems . . . . .                                                       | 174 |
| 7   | Eigenvalue and Dynamic Problems . . . . .                                                            | 179 |
| 7.1 | On the Eigenvalue Problem for Hemivariational Inequalities . .                                       | 179 |
| 7.2 | Dynamic Hemivariational Inequalities . . . . .                                                       | 190 |
| 7.3 | Applications to Engineering Problems: Von Kármán Plates and Thermoelasticity . . . . .               | 204 |
| 8   | Optimal Control and Identification Problems . . . . .                                                | 223 |
| 8.1 | Formulation of the Problem . . . . .                                                                 | 223 |
| 8.2 | Mathematical Study of the Optimal Control Problem Governed by Hemivariational Inequalities . . . . . | 226 |
| 8.3 | Applications to Engineering Problems . . . . .                                                       | 234 |

**IV    NUMERICAL APPLICATIONS**

|     |                                                                                      |     |
|-----|--------------------------------------------------------------------------------------|-----|
| 9   | On the Numerical Treatment of Hemivariational Inequalities . . . . .                 | 239 |
| 9.1 | The First Numerical Attempts and the Questions of Stability and Uniqueness . . . . . | 240 |
| 9.2 | The Microspring Approximation Method of the Decreasing Branch                        | 245 |

|      |                                                                                                                        |     |
|------|------------------------------------------------------------------------------------------------------------------------|-----|
| 9.3  | The Method of Decreasing Branch Approximation by Monotone Laws . . . . .                                               | 249 |
| 9.4  | Application I: Cleavage in Laminated Composites and the Nonmonotone Unilateral Contact Problem . . . . .               | 257 |
| 9.5  | Application II: The Nonmonotone Friction Problem and the Combined Unilateral Contact Problem with Nonmonotone Friction | 269 |
| 10   | On the Approximation of Hemivariational Inequalities by Variational Inequalities . . . . .                             | 281 |
| 10.1 | General Formulation of the Method . . . . .                                                                            | 281 |
| 10.2 | Application III: Nonmonotone Friction Interface Conditions with Debonding . . . . .                                    | 284 |
| 10.3 | Application IV :Adhesive Joints in Structural Mechanics . . . .                                                        | 290 |
| 10.4 | Application V : Comparison with the Path Following Method .                                                            | 297 |
| 10.5 | Application VI : Nonmonotone Stress-Strain Laws. The Sawtooth Behaviour of Composites . . . . .                        | 300 |
| 10.6 | Application VII : Shear Connectors in Composite Beams . . . .                                                          | 306 |
| 11   | The Method of Substationary Point Search . . . . .                                                                     | 317 |
| 11.1 | General Formulation of the Method . . . . .                                                                            | 317 |
| 11.2 | On the Numerical Implementation of the Algorithm. . . . .                                                              | 326 |
| 11.3 | Application VIII: Delamination and Adhesive Joints in Structural Mechanics . . . . .                                   | 331 |
| 11.4 | Application IX: Semirigid Connections in Steel Structures . . .                                                        | 338 |
| 12   | On a Decomposition Method into Two Convex Problems . . . . .                                                           | 345 |
| 12.1 | General Formulation of the Method . . . . .                                                                            | 345 |
| 12.2 | Application X: The Stamp Problem and the Interfacial Debonding in Composites . . . . .                                 | 351 |
| 13   | Dynamic Hemivariational Inequalities and Crack Problems . . . . .                                                      | 361 |
| 13.1 | Application XI: Numerical Treatment of Dynamic Hemivariational Inequalities . . . . .                                  | 361 |
| 13.2 | Application XII: The Unilateral Contact and Nonmonotone Friction Problem in Cracks . . . . .                           | 371 |
| 13.3 | Application XIII: Fracture of Cracks Repaired by an Adhesive Material . . . . .                                        | 376 |
| 14   | Applications of the Theory of Hemivariational Inequalities in Robotics                                                 | 377 |
| 14.1 | Application XIV: Adhesive Grasping Problem in Robotics . . .                                                           | 377 |
| 14.2 | Application XV: On the Optimal Control of the Adhesive Grasping Problem in Robotics . . . . .                          | 387 |
| 15   | Addenda: Hemivariational Inequalities, Fractals and Neural Networks                                                    | 393 |
| 15.1 | Fractals in Mechanics. An Introduction . . . . .                                                                       | 393 |
| 15.2 | Application XVI: Hemivariational Inequalities for Fractal Interfaces                                                   | 401 |

15.3 The Neural Network Approach to Hemivariational Inequalities . 406

15.4 Application XVII: D.C.B. Specimen Modelling. The Neural Net-  
work Approach . . . . . 409

15.5 Application XVIII: The Inverse Delamination Problem as a Su-  
pervised Learning Problem for a Neural Network. Extensions . . 412
