Preface xiii

1 Description of the Deformation and Kinematics of a Saturated Porous Medium. Mass Conservation 1

Introduction 1
1.1 Description of a Saturated Porous Medium 1
1.1.1 Connected and occluded porosity 1
1.1.2 Skeleton and fluid particles 2
1.1.3 Hypothesis of continuity 2
1.2 Description of the Skeleton Deformation 3
1.2.1 Deformation gradient 3
1.2.2 Transport formulae 4
1.2.3 Green–Lagrange strain tensor 5
1.2.4 Infinitesimal transformation. Linearized strain tensor. Plane strain field 6
1.2.5 Infinitesimal transformation and infinitesimal deformation 7
1.3 Kinematics of the Skeleton Deformation 7
1.3.1 Lagrangian and Eulerian description of the kinematics of deformation 7
1.3.2 Lagrangian strain rate tensor 8
1.3.3 Eulerian strain rate tensor 8
1.4 Lagrangian and Eulerian Description of the Motion of Saturated Porous Medium. Relative Flow Vector of Fluid Mass 10
1.5 Particulate Derivative and Material Derivative 11
1.5.1 Particulate derivative of a field with respect to the skeleton 11
1.5.2 Particulate derivative of a field with respect to the fluid 11
1.5.3 Particulate derivative of a volume integral with respect to the skeleton 12
1.5.4 Particulate derivative of a volume integral with respect to the fluid 14
1.5.5 Material derivative of a volume integral 16
1.5.5.1 Definition 16
1.5.5.2 Material derivative of a volume integral and conservation laws 19
1.6 Mass Conservation 19
1.6.1 Existence of the relative flow vector of fluid mass. The tetrahedron lemma 19
1.6.2 Eulerian formulation of mass conservation 20
1.6.3 Lagrangian formulation of mass conservation. Variation in fluid mass content 22

2 Momentum Balance. Stress Tensor 27

Introduction 27
2.1 Momentum Balance 27
2.1.1 Momentum balance for a saturated porous medium 27
2.1.2 Euler theorem 28
2.1.3 Dynamic theorem 29

2.1.4 Cauchy stress tensor 31
2.1.5 Equation of motion 32
2.1.6 Symmetry of stress tensor 32
2.1.7 Partial stress and intergranular stress concepts 33
2.2 Strain Work Rate. Theorem of Virtual Work Rate 35
2.2.1 Strain work rate 35
2.2.2 Theorem of virtual work rate 36
2.3 Lagrangian Approach of the Momentum Balance 37
2.3.1 Piola–Kirchhoff stress tensor 37
2.3.2 The equation of motion 37
2.3.3 Piola–Lagrange or Boussinesq stress tensor 38
2.4 Kinetic Energy Theorem 38
2.4.1 Material derivative of kinetic energy 38
2.4.2 Effect of tortuosity 39
2.4.3 Kinetic energy theorem 42
Appendix: The Intergranular Stress Concept 43

3 Thermodynamics of Open Continua 47

Introduction 47
3.1 Postulate of Local State 48
3.1.1 State variables 48
3.1.2 Postulate of local state for homogeneous systems 48
3.1.3 Local state postulate for continua 49
3.2 The First Law 50
3.2.1 Formulation of the first law 50
3.2.2 The kinetic energy theorem revisited 52
3.2.3 The energy equation, Eulerian approach 53
3.2.4 The energy equation, Lagrangian approach 54
3.3 The Second Law 55
3.3.1 Formulation of the second law 55
3.3.2 The fundamental inequality, Eulerian approach 57
3.3.3 The fundamental inequality, Lagrangian approach 59
3.3.4 Identification of dissipations. Thermal equation 60
3.4 A General Approach to Constitutive Equations of Elementary Systems 62
3.4.1 Non-negativeness of the intrinsic dissipation 62
3.4.2 Equations of state of elementary systems 63
3.4.3 Internal variables and intrinsic dissipation. Necessity of complementary evolution relations 64
3.4.4 The particular case of thermoporoelastic behaviour 65
3.4.5 Hypothesis of normal dissipative mechanism. Standard behaviour 66
3.5 Conduction Laws for Heat and Fluid Mass 69
3.5.1 Hypothesis of the decoupling of dissipations 69
3.5.2 Heat conduction law 70
3.5.3 Fluid mass conduction law 71
3.5.3.1 Formulation of the law 71
3.5.3.2 Fluid particle head. Bernoulli theorem 74
3.5.4 Coupling of conduction laws. Knudsen effect 76
3.6 Adiabatic and Isothermal Evolutions. Undrained and Drained Evolutions 78
3.7 Physical Laws Governing the Evolution of a Saturated Porous Medium 80

4 Linear Thermoporoelastic Behaviour 83

Introduction 83
4.1 Linearized Fluid State Equations 84

4.2 Linear Thermoporoelastic Behaviour 85
4.2.1 Linearization for the saturated porous medium 86
4.2.2 Constitutive equations in linear thermoporoelasticity 86
4.2.3 Physical meaning of coefficients 87
4.2.3.1 Initial conditions 87
4.2.3.2 Physical meaning of the intrinsic properties of the porous material 87
4.2.3.3 Adiabatic characteristics 89
4.2.4 Effective stress tensor in thermoporoelasticity 89
4.2.5 Reduced potential. Constitutive equation inversion 91
4.2.6 Linear isotropic thermoporoelastic behaviour 95
4.2.7 Stress-free initial state 98
4.3 Linear Thermoporoelastic Bahaviour in Infinitesimal Transformations 99
4.3.1 Hypothesis of infinitesimal transformation 99
4.3.2 Stress-free initial state 99
4.3.3 The meaning of the isotropic properties and the principle of their experimental determination. Skempton coefficient 100
4.3.4 Prestressed initial state 103
4.4 Stability of the Thermoporoelastic Material 104
4.4.1 Convex functions 104
4.4.2 Stability of the thermoporoelastic material 106
4.5 Characteristics of the Thermoporoelastic Material and Characteristics of its Constituents 111
4.5.1 Compatibility relations between the properties of the thermoporoelastic material and those of its constituents 112
4.5.2 Stability of the thermoporoelastic material and its constituents 120
4.5.3 Effective stress and the constituents. The Terzaghi assumption 120
4.6 Examples of Thermoporoelastic Anisotropic Materials 123
4.6.1 Orthotropic thermoporoelastic material 124
4.6.2 Transversely isotropic thermoporoelastic material 126

5 Poroplastic Behaviour 129

Introduction 129
5.1 State Equations of Thermoporoelastoplasticity 130
5.1.1 Plastic strain and plastic porosity 130
5.1.2 State equations 133
5.1.3 Reduced potentials. State equations inversion 135
5.2 General Formulation of Complementary Evolution Relations 136
5.2.1 Intrinsic dissipation. Plastic work rate. Hardening frozen energy 136
5.2.2 Plasticity criterion 138
5.2.2.1 Loading point and initial elasticity domain 138
5.2.2.2 Ideal plastic porous material 138
5.2.2.3 Hardening plastic porous material 139
5.2.2.4 Convexity of elasticity domains 142
5.2.3 Flow rule 143
5.2.3.1 Ideal plastic material 143
5.2.3.2 Hardening plastic porous material. Hardening and softening 145
5.2.4 Effective stress in poroplasticity 151
5.3 The Poroplastic Behaviour in the Hypothesis of Maximal Plastic Work 153
5.3.1 Hypothesis of maximal plastic work 153
5.3.2 Consequences for the plastic criterion and the flow rule 154
5.3.3 Maximal plastic work and plastic effective stress 155
5.3.4 Maximal plastic work and normal dissipative mechanisms 156
5.3.5 Standard material. Associated flow rule 157
5.3.5.1 Ideal plastic standard material 158
5.3.5.2 Hardening standard material 158

5.3.6 Stability and the hypothesis of maximal plastic work 159
5.3.6.1 Sufficient conditions for isothermal stability of poroplastic materials 159
5.3.6.2 Drucker–Ilyushin's stability postulate 163
5.3.7 Extended standard materials 165
5.4 Non-standard Poroplastic Behaviour 168
5.4.1 Non-associated flow rule 168
5.4.2 Non-associated potentials 169
5.4.3 Effective stress and non-associated potentials 171
5.5 Incremental Formulation of Poroelastoplastic Constitutive Equations 172
5.5.1 Incremental formulation for the standard material. Incremental potentials 172
5.5.2 Incremental formulation for the non-standard material 180
5.5.3 Incremental formulation and effective stress 183
5.5.4 Drained and undrained tangent moduli 184
5.6 Usual Models of Isotropic Poroplasticity 185
5.6.1 General formulation of an isotropic poroplastic model 185
5.6.1.1 Isotropic criterion 185
5.6.1.2 Flow rule. Plastic dilatancy factor. Equivalent distortion. Deviatoric normality 187
5.6.1.3 Hardening law 189
5.6.1.4 Thermodynamic restrictions 189
5.6.2 A usual model 190
5.6.2.1 Criteria of von Mises and Drucker–Prager 190
5.6.2.2 Flow rule 192
5.6.2.3 Hardening laws 194
5.6.2.4 Thermodynamic restrictions 196
5.6.3 The Cambridge model 197
5.6.3.1 Burland criterion 197
5.6.3.2 Flow rule 198
5.6.3.3 Plastic void ratio. Hardening rule. Critical state concept 199
5.6.3.4 Thermodynamic restrictions 204
Appendix: Thermal Hardening 206

6 Hereditary Behaviours 209

Introduction 209
6.1 Viscous Strain and Viscous Porosity 209
6.1.1 Relaxed state 209
6.1.2 Viscous strain and viscous porosity 209
6.2 Zener Poroviscoelastic Model 211
6.2.1 State equations 211
6.2.2 Complementary evolution laws. Zener material 213
6.2.3 Instantaneous and relaxed characteristics. Frozen energy 214
6.2.4 Sufficient conditions of stability of a relaxed equilibrium state 216
6.2.5 Creep and relaxation function for the isotropic Zener material 217
6.2.5.1 Functional writing of constitutive equations 217
6.2.5.2 Creep and relaxation functions 220
6.2.5.3 Functional writing of free energy and intrinsic viscous dissipation 223
6.3 Linear Poroviscoelastic Behaviour 226
6.3.1 Functional formulation 226
6.3.1.1 The general case 226
6.3.1.2 The isotropic case 228
6.3.1.3 Compatibility relations between poroviscoelastic properties and constituent properties 230
6.3.2 Effective stress in poroviscoelasticity 231

6.3.3 Thermodynamic restrictions 232
6.3.4 Ageing material 237
6.4 Poroviscoplastic Behaviour 239
6.4.1 Generalities 239
6.4.2 State equations 241
6.4.3 General formulation of complementary evolution laws. Effective stress in poroviscoplasticity 242
6.4.4 Standard poroviscoplastic materials 243
6.4.4.1 Standard ideal poroviscoplastic material 243
6.4.4.2 Standard hardening poroviscoplastic material 243
6.4.4.3 Extended standard poroviscoplastic material 244
6.4.4.4 Stability of standard poroviscoplastic material 244
6.4.5 Poroviscoplastic models 245
6.4.5.1 Usual models 245
6.4.5.2 Poroviscoplastic extension of poroplastic models 246

7 Surfaces of Discontinuity 249

Introduction 249
7.1 Kinematics of Discontinuities 249
7.1.1 Displacement speed and various wavespeeds 249
7.1.2 Geometrical and kinematical conditions of compatibility 252
7.1.2.1 Hadamard's relations 252
7.1.2.2 Application to first and second-order discontinuities. Polarization vector. Longitudinal and transverse waves 253
7.2 Conservations Laws and Acceleration Waves 255
7.2.1 Hypothesis of small movements 255
7.2.2 Mass conservation 256
7.2.3 Momentum balance 257
7.2.4 Propagation of acceleration waves 257
7.2.4.1 The undrained acoustic tensor 257
7.2.4.2 Polarization vector and wavespeeds 258
7.2.4.3 Equation of the wavefront 260
7.3 Wave Propagation in Thermoporoelastic Media 260
7.3.1 The isotropic homogeneous case 261
7.3.1.1 Equations of the problem 261
7.3.1.2 Acceleration waves. Shear and compression waves. Thermal waves 262
7.3.1.3 Shock waves 269
7.3.2 The general case 270
7.4 Wave Propagation in Poroplastic Media 271
7.4.1 Plastic acceleration wave 271
7.4.2 Elastic unloading wave. Plastic loading wave 273
7.4.3 Remark on plastic shock waves 274
7.5 Localization of Deformation in Poroelastoplasticity 274
7.5.1 Velocity discontinuity in ideal plasticity 274
7.5.1.1 Generalities 274
7.5.1.2 Application 276
7.5.2 Localization of deformation for hardening materials 280
7.5.2.1 Generalities 280
7.5.2.2 Critical hardening modulus 283
7.6 Wave Propagation in Poroviscoelastic Media 288
7.6.1 Acceleration wave. Complex modulus 288
7.6.2 Shock waves 291
7.7 The Porous Fracture 293

8 Linearized Quasistatic Evolutions in Thermoporoelasticity. Direct Methods of Resolution 299

Introduction 299
8.1 The Hypothesis of Small Perturbations 299
8.2 Linearized Formulation of an Evolution Quasistatic Problem 300
8.2.1 Field equations 301
8.2.1.1 Momentum equation 301
8.2.1.2 The equation of fluid diffusion 301
8.2.1.3 The equation of heat diffusion 302
8.2.2 Boundary and initial conditions 303
8.2.3 Constitutive equations 304
8.3 The Displacement Method 305
8.3.1 The Navier equation 305
8.3.2 The equation of fluid diffusion 305
8.3.3 The equation of heat diffusion 305
8.3.4 Solving a problem by the displacement method 306
8.4 The Stress Method 306
8.4.1 The Beltrami–Michell equation 306
8.4.2 The equation of fluid diffusion 308
8.4.3 The equation of heat diffusion 308
8.4.4 Solving a problem by the stress method 308
8.5 The Diffusion Process Analysed 308
8.5.1 Coupling of entropy and fluid mass diffusion. The consolidation equation 308
8.5.2 Short- and long-term approximations. Characteristic length and characteristic time of diffusion 310
8.6 The Superposition Theorem 314
8.7 Applications 314
8.7.1 Drilling of a well 314
8.7.1.1 The problem 314
8.7.1.2 Analytical solution 316
8.7.2 The case of a spherical cavity 322
8.7.2.1 The problem 322
8.7.2.2 Analytical solution 323
8.7.3 Consolidation of a soil layer 327
8.7.3.1 The problem 327
8.7.3.2 Analytical solution 328
8.7.4 Line injection of a fluid in a reservoir 335
8.7.4.1 The problem 335
8.7.4.2 Analytical solution 336

9 Quasistatic Evolutions. Uniqueness of Solution. Numerical Methods of Resolution. 341

Introduction 341
9.1 Formulation of an Evolution Problem 341
9.2 Theorem of Virtual Work Rate with Two Fields 343
9.3 Theorems of Uniqueness of Solution 346
9.3.1 Uniqueness theorem in poroelasticty 346
9.3.2 Uniqueness theorems in poroelastoplasticity 347
9.3.2.1 Ideal plastic material 347
9.3.2.2 Hardening plastic material 349
9.3.3 Uniqueness theorem in linear poroviscoelasticity 353
9.3.4 Uniqueness theorem in poroviscoplasticity 355
9.3.4.1 Ideal poroviscoplastic material 355
9.3.4.2 Hardening poroviscoplastic material 355

9.4 Principle of the Numerical Solving Method 356
9.4.1 Time discretization 357
9.4.1.1 Time discretization of field equations and boundary conditions 357
9.4.1.2 Kinematically and statically admissible fields in finite discretization 357
9.4.1.3 Theorems of virtual work for finite increments 358
9.4.1.4 Discretization of conduction laws and constitutive equations. Explicit and implicit procedures 360
9.4.2 Variational formulation of the time-discretized problem 363
9.4.2.1 Variational formulation in poroelasticity 363
9.4.2.2 Variational formulation in poroplasticity 368
9.4.2.3 Variational formulation for hereditary behaviours 377
9.4.3 Spatial discretization 380
Appendix: Existence Theorem of the Solution of an Evolution Problem 381

10 Reactive Partially Saturated Porous Media 385

Introduction 385
10.1 Description of the Deformation and Kinematics 385
10.1.1 Hypothesis of continuity 385
10.1.2 Deformation and kinematics 386
10.2 Mass Conservation 386
10.2.1 Mass conservation for non-reactive media 387
10.2.2 Mass conservation with phase change 387
10.2.2.1 Double porous network 387
10.2.2.2 Liquid–vapour phase change 388
10.2.2.3 Matrix dissolution 388
10.2.2.4 Liquid–solid phase change 389
10.2.3 Mass conservation in the case of chemical reactions 389
10.3 Momentum Balance 390
10.3.1 Stress tensor 390
10.3.2 Momentum equation 391
10.4 Thermodynamics of Reactive Partially Saturated Porous Media 391
10.4.1 The first law. The equation of energy 391
10.4.2 The second law 391
10.4.3 The fundamental inequality 391
10.4.3.1 The fundamental inequality for non-reactive media 392
10.4.3.2 The fundamental inequality with phase change 392
10.4.3.3 The fundamental inequality with chemical reactions 392
10.4.4 Identification of dissipations. The thermal equation 393
10.4.5 Constitutive equations of elementary systems 393
10.4.5.1 Non-negativeness of the intrinsic dissipation 393
10.4.5.2 State equations and complementary evolution relations 394
10.4.6 Laws of phase change 395
10.4.6.1 Double porous network 395
10.4.6.2 Liquid–vapour phase change 395
10.4.6.3 Matrix dissolution 397
10.4.6.4 Liquid–solid phase change 398
10.4.7 Kinetics of chemical reactions 399
10.4.8 Closed reactive porous media 400
10.4.9 Conduction laws 401
10.4.9.1 Fourier law 402
10.4.9.2 The generalized Darcy law 402
10.4.9.3 Fick's law 403
10.4.9.4 Soret–Dufour effect 405
10.5 Thermoporoelastic Behaviour 406
10.5.1 Linear model 406

10.5.2 Non-linear model 408
10.5.3 Properties of the thermoporoelastic material and properties of its constituents 410
10.5.3.1 Saturing fluids without mixture 411
10.5.3.2 Saturing fluids with ideal mixture 412
10.5.4 The effective stress assumption for partially saturated porous media 416
10.5.5 Porous media partially saturated by a liquid and a mixture 417
10.5.5.1 Constitutive equations. Capillary pressure 417
10.5.5.2 Effective stress assumption. Capillary pressure curve 420
10.5.5.3 Capillary desorption. Adsorption isotherms 424
10.5.6 Reduced potential 426
10.5.7 Thermodynamic restrictions 427
10.6 Shrinking, Swelling and Creeping Materials as Reactive Partially Saturated Porous Materials 430
10.6.1 Drying shrinkage 430
10.6.2 Swelling through osmosis 432
10.6.3 Swelling and shrinkage due to chemical reactions 435
10.6.4 Creep due to chemical reactions 436
