Preface	xi
CHAPTER 1 Fundamentals of vibration damping.....	1
1.1 Vibration.....	2
1.2 Importance of the study of vibration	2
1.3 Simple harmonic motion (SHM)	4
1.3.1 Displacement, velocity, and acceleration.....	5
1.3.2 Free vibration and natural frequency	6
1.3.3 Forced vibration and resonance	6
1.4 Random vibration	7
1.5 Undamped and damped vibration	7
1.5.1 Expressions for free, undamped vibration	8
1.5.2 Expressions for free damped vibration	10
1.5.3 Forced vibration.....	14
1.6 Summary.....	22
1.7 Examples of forced vibration.....	23
1.8 Selection of mount materials for vibration damping of machinery	30
1.9 Testing of vibration	34
A Appendix.....	36
A.1 Selection of VEM for a mount based on compression data	36
A.2 Selection of mount material	38
References	41
General reading	42
CHAPTER 2 Fundamentals of shock damping.....	43
2.1 Shock and transient phenomena.....	44
2.1.1 Excitation function	45
2.1.2 Frequency domain expression	46
2.2 Shock response of a linear, SDOF system.....	47
2.2.1 Maximax response or shock response spectra (SRS)	50
2.2.2 Significance of SRS.....	51
2.3 Shock response with damping.....	52
2.3.1 Example of damped shock response	56
2.4 Shock severity	57

2.5	Selection of polymeric materials for shock and vibration mounts	58
2.5.1	Steps to select S&V mount	58
2.5.2	Example of S&V mount selection	61
	References	67
	General reading	67

CHAPTER 3 Viscoelasticity 69

3.1	Elastic deformation-Hookean solid	71
3.1.1	Engineering and true stress-strain	73
3.1.2	Stress-strain characteristics of polymers	74
3.1.3	Poisson's ratio	76
3.1.4	Flexure mode deformation	77
3.1.5	Rubber elasticity	78
3.2	Newtonian fluids	80
3.3	Non-Newtonian fluids	81
3.4	Viscoelastic body	85
3.4.1	Linear viscoelasticity	86
3.4.2	Relaxation and retardation spectra	87
3.4.3	Maxwell's model: Series arrangement	88
3.4.4	Maxwell's viscoelastic model with past memory	92
3.4.5	Generalised Maxwell's model	94
3.4.6	Kelvin-Voigt model	96
3.4.7	Three-parameter models	98
3.4.8	Four-parameter model	102
3.4.9	Semiempirical models	104
3.4.10	Comparison of models	104
3.4.11	Example of creep of elastomeric blend materials	106
3.5	Dynamic viscoelastic property	108
3.5.1	Relaxation of chain segments	108
3.5.2	Effect of temperature	108
3.5.3	Dynamic properties	110
3.5.4	Dynamic loading of Maxwell's model	112
3.5.5	Dynamic loading of Kelvin-Voigt model	113
3.5.6	Dynamic loading of Zenner model	114
3.6	Energy loss in dynamic loading	117
3.7	Dependence of dynamic properties on temperature	119
3.8	Relaxation in dynamic viscoelasticity	120
3.8.1	Temperature dependence	120
3.8.2	Frequency dependence	121

3.9	Frequency multiplexing-time-temperature superposition	121
3.9.1	Arrhenius and WLF methods	121
3.9.2	Reference temperature	122
3.9.3	Steps for WLF shift	122
3.9.4	Shift factor	123
3.9.5	Graphical method of frequency master curve	125
3.10	Examples of dynamic viscoelasticity of polymers	125
3.10.1	Neat and filled thermoplastic polymer	126
3.10.2	Epoxy network with natural polymeric flake filler	126
3.10.3	A standard sample of poly(methyl methacrylate)	128
3.10.4	DMA spectra of natural rubber	129
3.10.5	DMA of nitrile-phenolic blends	131
3.11	Comparison of static and dynamic mechanical properties	133
3.11.1	Static and dynamic modulus	133
3.11.2	Hardness-modulus relationship	133
3.11.3	Comparison of static and dynamic modulus	136
3.11.4	Experimental results of static and dynamic modulus	138
3.11.5	Modulus by relaxation and creep experiments	138
3.11.6	Relaxation frequency from static relaxation experiment	139
	References	140
	General reading	141
CHAPTER 4	Design of polymer systems for vibration damping	143
4.1	Introduction	144
4.2	Thermoplastic and thermoset polymers	145
4.3	Glass transition of polymers	146
4.3.1	Prediction of T_g of thermoset	149
4.3.2	Cross-link density of thermoset resins and rubbers	150
4.4	Selection of polymer for vibration damping	152
4.5	Design of polymer systems for vibration damping	154
4.5.1	Copolymers	154
4.5.2	Polymer blends	159
4.5.3	Epoxy-based damping materials	161
4.5.4	Polyurethane-based damping materials	167
4.5.5	Interpenetrating polymer networks (IPN)	171
4.6	Nanostructured damping materials	178
4.6.1	Layered silicate-based polymer nanocomposite	179
4.6.2	CNT-based polymer nanocomposites	183
4.6.3	Graphene-based nanostructured damping materials	193

4.7	Vibration damping of composite structure	195
4.7.1	Polymer matrix composites	195
4.7.2	Vibration damping property of FRP composites	196
	References	198
CHAPTER 5	Mode of damping	203
5.1	Introduction	206
5.2	Constrained layer damping (CLD) arrangement	207
5.2.1	Configuration	207
5.2.2	Theoretical analysis: Early developments	208
5.2.3	RKU and other equations	212
5.2.4	FEM analysis	224
5.2.5	General conclusion	227
5.2.6	Comparison of closed form and FEM	227
5.2.7	Partially covered CLD	228
5.2.8	Passive damping by piezoelectric and magnetic materials	231
5.3	Passive and active CLD (P and ACLD)	233
5.3.1	Fundamental principle of ACLD	234
5.3.2	Configuration of AVC	235
5.3.3	Active-passive combined CLD	237
5.4	CLD performance of some VEMs	238
5.4.1	PU-NanoFillers	239
5.4.2	Composite honeycomb structures (airframes)—CLD of EAP-32 VEM	239
5.4.3	Internally damped FRP lightweight structures (LIST)	240
5.4.4	Damping bushes and gaskets	241
5.4.5	CLD based on EAP-1 and 2 for aluminium vibrating substrate	243
5.4.6	Sprayable damping coating for CLD	243
5.5	Free layer damping (FLD)	245
5.5.1	Initial experiments with FLD	246
5.5.2	Predictive models	246
5.5.3	Polymer selection for FLD treatment	251
5.5.4	Example of FLD application	255
5.6	Effect of fillers/reinforcements	258
5.6.1	Shape and clustering of particles in hysteretic damping	258
5.6.2	Hysteresis, CLD, and FLD performances	260
5.6.3	Effect of inclusion in polymer	263
5.7	Interfacial damping	264
5.7.1	Coulomb damping	265

5.8	Rayleigh damping.....	269
5.9	Frictional damping for polymer composites.....	271
5.10	Interface friction damping for passive damping systems.....	274
	References	275

CHAPTER 6	Experimental techniques and instruments for vibration damping.....	281
6.1	Experimental techniques	282
6.1.1	Universal testing machine	284
6.1.2	Tensile test method.....	284
6.1.3	Tensile test.....	286
6.2	Compression test	287
6.2.1	Instrument	288
6.2.2	Measurement method	289
6.2.3	Compression of actual item.....	292
6.3	Shear test	293
6.3.1	Instrument	293
6.3.2	Standards.....	293
6.3.3	Methods for testing of shear stress–strain.....	293
6.3.4	Stress relaxation and creep experiment in shear.....	295
6.4	Flexure test	296
6.4.1	Instrument and specimen.....	296
6.4.2	Stress, strain for short span	297
6.4.3	Stress, strain for large span	297
6.4.4	Stress, strain in four-point bending.....	298
6.5	Hardness test.....	298
6.5.1	Shore durometer and shore scale	299
6.5.2	Measurement.....	299
6.5.3	Rockwell hardness test	301
6.5.4	Standard and measurement.....	301
6.6	Dynamic mechanical analysis.....	302
6.6.1	Standard	303
6.6.2	The DMA instrument	303
6.6.3	Operational features.....	304
6.6.4	Data sampling.....	304
6.6.5	Sample dimension.....	305
6.6.6	Specification of DMA instrument.....	305
6.6.7	Critical considerations	305

6.7	Vibration tests.....	308
6.7.1	Instrumented hammer	308
6.7.2	Critical considerations	310
6.7.3	Electrodynamic shaker: Frequency sweep, forced vibration.....	310
6.7.4	The machine	311
6.7.5	Brief performance features.....	312
6.7.6	Test method	313
6.7.7	Example	313
6.7.8	Modal shakers.....	315
6.7.9	Important considerations	316
6.8	Shock testing	317
6.8.1	Test equipment	317
6.8.2	Functional features	318
6.8.3	Test method	319
6.9	Ageing study.....	320
6.9.1	Example of thermal ageing	321
6.9.2	Lifetime estimation.....	321
6.10	Effectiveness of S&V damping	323
	References	324
	Index	327
