CONTENTS

Preface xix

1. Basic concepts 1
1.1 Introduction 1
1.2 Prestressed concrete 1
1.3 Economics of prestressed concrete 4

2. Technology of prestressing 5
2.1 Methods of prestressing 5
2.2 Pre-tensioning 5
2.2.1 Debonding/blanketing of strands 10
2.2.2 Deflecting/draping/harping of strands 11
2.2.3 Loss of prestress at transfer 12
2.2.4 Transmission length 12
2.2.4.1 Example of calculation of transmission length 14
2.3 Post-tensioning 15
2.3.1 Post-tensioning anchors 18
2.3.2 Loss of prestress at transfer 21
2.3.3 External prestressing 21
2.3.4 Unbonded systems 22

3. Material properties 25
3.1 Properties of concrete 25
3.2 Compressive strength of concrete 25
3.3 Tensile strength of concrete 26
3.4 Deformational properties 27
3.4.1 Elastic moduli 27
3.4.2 Creep coefficient 27
3.4.3 Shrinkage 31
3.5 Stress-strain relationship 33
3.5.1 Parabolic-rectangular relationship 34
3.5.2 Bi-linear relationship 35
3.5.3 Confined concrete 35
3.6 Permissible stresses in concrete 36
3.7 Prestressing steel 37
3.8 Relaxation 39
3.9 Maximum Stress at Jacking 40
3.10 Long-term loss of prestress 40
3.11 References to Eurocode 2 clauses 40

4. Serviceability limit state design of pre-tensioned beams 43
4.1 Design of prestressed concrete structure 43
4.2 Beam design based on engineers' theory of bending 43
4.2.1 Sign convention 44
4.2.2 Example of beam designed based on engineer's theory of bending 44
4.3 Development of SLS design equations 47
4.3.1 Example of SLS design equations 49
4.3.2 Magnel diagram 50
4.3.3 Choice of prestress and eccentricity 52
4.3.4 Stress check 53
4.3.5 Debonding 54
4.3.6 Choice of prestress and eccentricity at different sections 56
4.4 Initial sizing of section 56
4.4.1 Example of preliminary sizing 58
4.5 Composite beam section 59
4.5.1 Magnel equations for composite beam 60
4.5.2 Shrinkage stress calculation 61
4.5.3 Example of shrinkage stress calculation 64
4.5.4 Magnel diagrams for a composite beam 67
4.5.5 Choice of prestress and eccentricity at different sections 70
4.6 Cracking 71
4.7 Thermal stress calculation 71
4.7.1 Heating 72
4.7.2 Cooling 73
4.7.3 Calculation of stresses due to thermal gradients 73
4.7.4 Example of thermal stress calculation 74
4.7.4.1 Thermal stress calculation: Heating 75
4.7.4.2 Thermal stress calculation: Cooling 78
4.8 Detailing 79
4.9 References to Eurocode 1 and Eurocode 2 clauses 80

5. Bonded post-tensioned structures 81
5.1 Post-tensioned beams 81
5.2 Cable profile in a post-tensioned beam 81
5.2.1 Example of permitted cable zone 82
5.2.1.1 Magnel equations 85
5.2.1.2 Determination of maximum eccentricity 85
5.2.1.3 Determination of cable zone 87
5.2.1.4 Detailing of post-tensioned tendons 88
5.3 Concept of equivalent loads 88
5.3.1 General equation for equivalent loads 90
5.3.2 General equation for distributed loads for a parabolic profile 91

5.3.3 Drape of the cable 93
5.4 Load balancing 94
5.5 Reference to Eurocode 2 clauses 94

6. Statically indeterminate post-tensioned structures 95
6.1 Introduction 95
6.1.1 Primary and secondary moments 95
6.1.2 Prestressing of a propped cantilever 97
6.2 Analysis to determine the moment distribution due to prestress 98
6.2.1 Equivalent loads for a cable profile of a single parabola 99
6.2.2 General equation for equivalent loads for a cable profileconsisting of three parabolic segments 100
6.2.3 General equation for equivalent loads for a cable profile consisting of four parabolic segments 105
6.2.3.1 Alternative profile consisting of three parabolas instead of four parabolas 111
6.2.3.2 Alternative profile consisting of two parabolas instead of three parabolas 114
6.2.4 Loss of prestress and equivalent loads 116
6.3 Fixed end moments 116
6.3.1 Fixed end moments for three-parabola cable profile 117
6.3.2 Fixed end moments for four-parabola cable profile 118
6.4 Analysis of a continuous beam for moment distribution due to prestress 118
6.4.1 Distribution of shear force 121
6.5 Cable profile consisting of linear variation between supports 122
6.6 Determination of prestress and cable profile: Example of a continuous bridge beam 122
6.6.1 Analysis of the bridge 123
6.6.2 Determination of prestress and eccentricity 126
6.6.3 Refined analysis due to equivalent loads 128
6.6.3.1 Fixed end moments for three parabola cable profile 129
6.6.3.2 Fixed end moments for four parabola cable profile 129
6.6.3.3 Moments at supports for the cable profile 129
6.6.3.4 Choice of prestress at service 129
6.6.3.5 Stress check at transfer and service 132
6.7 Concordant cable profile 132
6.8 Choice of tendon size and location of tendons 132
6.9 Equivalent loads and shift in the centroidal axis 134
6.9.1 Shift in the centroidal axis in box girders 136
6.10 Equivalent loads and variable second moment of area 136
6.11 Thermal stress analysis and continuous structures 139

6.11.1 Thermal stress calculation: heating 139
6.11.2 Thermal stress calculation: cooling 142
6.12 Reduction of moment over support in continuous beams 144
6.13 References to Eurocode 2 clauses 145

7. Ultimate bending strength calculations 147
7.1 Introduction 147
7.2 Stress distribution at different stages of loading 147
7.3 Stress - strain relationship for concrete 149
7.4 Rectangular stress block in bending strength calculations 149
7.5 Stress - strain relationship for steel 150
7.6 Strain and stress in steel 150
7.6.1 Prestress and pre-strain in steel 150
7.6.2 Strain due to bending in steel 151
7.6.3 Total strain and stress in steel 151
7.7 The strain compatibility method 151
7.8 Properties of a trapezium 152
7.9 Ultimate moment calculation of a bridge beam 152
7.10 Ultimate moment calculation of a composite bridge beam 157
7.11 Use of additional unstressed steel 162
7.12 Stress-strain relationship for unstressed reinforcing steel 163
7.13 Example of ultimate moment calculation with stressed and unstressed steels 164
7.14 Calculation of M_u using tabular values 167
7.15 Calculation of M_u for statically indeterminate beams 169
7.16 Reference to Eurocode 2 clauses 170

8. Analysis of cracked sections 171
8.1 Introduction 171
8.2 Cracked section analysis 171
8.3 Cracked section analysis of a double T-beam 172
8.3.1 Stress - strain relationship for concrete 174
8.3.2 Stress - strain relationship for steel 174
8.3.3 Cracked section analysis 174
8.4 Partially prestressed beam 180
8.5 Composite beam 183
8.5.1 Magnel diagram for composite beam 184

9. Ultimate shear and torsional strength calculations 193
9.1 Introduction 193
9.2 Shear capacity of a section without shear reinforcement and uncracked in flexure 195

9.2.1 Example of calculation of shear capacity of a section without shear reinforcement and uncracked in bending 197
9.3 Checking for start of cracked section 198
9.4 Shear capacity of a section without shear reinforcement and cracked in bending 198
9.4.1 Example of calculation of shear capacity of a section without shear reinforcement and cracked in bending 199
9.5 Design of shear reinforcement 200
9.5.1 Derivation of equations (9.7) and (9.11) 201
9.5.2 Procedure for shear link design 203
9.5.3 Design of a beam not needing design shear reinforcement 203
9.5.4 Design of a beam needing design shear reinforcement 204
9.6 Shear capacity of a composite beam 207
9.7 Effective web width in the presence of ducts 212
9.8 Interface shear between web and flange in T-sections 213
9.8.1 Example of reinforcement calculation for interface shear between web and flange 214
9.9 Interface shear between precast beam and cast in-situ slab 215
9.10 Design for torsion 219
9.10.1 Spacing of torsion reinforcement 227
9.11 Design for combined shear force and torsion 227
9.12 Warping torsion 228
9.13 References to Eurocode 2 clauses 228

10. Calculation of crack widths 229
10.1 Introduction 229
10.2 Exposure classes 229
10.3 Recommended values of maximum crack width 229
10.4 Minimum steel areas 231
10.4.1 Example of minimum steel area calculation 233
10.5 Calculation of crack width, wk 234
10.5.1 Crack spacing, Sr, max 235
10.5.2 Example of crack width and spacing calculation 235
10.6 Example of a partially prestressed beam 236
10.6.1 Example of minimum steel area calculation 236
10.6.2 Example of width and spacing of crack 237
10.7 Control of cracking without direct calculation 238
10.8 References to Eurocode 2 clauses 239

11. Loss of prestress 241
11.1 Introduction 241
11.2 Immediate loss of prestress 241

11.2.1 Elastic loss in pre-tensioned beams 241
11.2.1.1 Example of elastic loss calculation 243
11.2.2 Elastic loss in post-tensioned beams 244
11.2.3 Loss of prestress due to friction and wobble 245
11.2.3.1 Derivation of loss of prestress due to friction 245
11.2.3.2 Example of calculation of loss of prestress due to friction and wobble 247
11.2.3.3 Calculation of θ for different profiles 248
11.2.4 Loss due to draw-in of wedges 252
11.2.4.1 Example of loss of prestress due to draw-in 254
11.3 Loss of prestress due to creep, shrinkage and relaxation 255
11.3.1 Example of final loss calculation 257
11.4 References to Eurocode 2 clauses 259

12. Design of slabs 261
12.1 Introduction 261
12.2 Typical beam and slab depths 261
12.2.1 Effective span of slabs for different support conditions 262
12.3 One-way spanning slabs 262
12.3.1 Design of a one-way spanning slab 263
12.3.2 Analysis for applied loading 264
12.3.3 Choice of prestress 266
12.3.4 Calculation of losses 267
12.3.5 Calculation of correct equivalent loads 269
12.3.6 Calculation of moment distribution at service 270
12.3.7 Calculation of stress distribution at service 271
12.3.8 Calculation of stress distribution at transfer 272
12.4 Edge-supported two-way spanning slab 272
12.4.1 Design of a two-way spanning slab 273
12.5 Flat slabs 276
12.6 Methods of analysis of flat slabs 279
12.7 Example of the design of flat slab 283
12.8 Finite element analysis of flat slab 283
12.8.1 Results of analysis for dead load 284
12.8.2 Results of analysis for dead plus live load pattern 1 288
12.8.3 Results of analysis for dead plus live load pattern 2 294
12.8.4 Results of analysis for dead plus live load pattern 3 298
12.8.5 Results of analysis for dead plus live load pattern 4 303
12.9 Finite element analysis of a strip of flat slab 307
12.9.1 Results of analysis for dead load 309
12.9.2 Results of analysis for dead plus live load pattern 1 312
12.9.3 Results of analysis for dead plus live load pattern 2 315
12.9.4 Results of analysis for dead plus live load pattern 3 318
12.9.5 Results of analysis for dead plus live load pattern 4 321

12.10 Comparison between the results of analysis of full slab and a strip of slab 324
12.11 Eurocode 2 recommendations for equivalent frame analysis 324
12.12 Grillage analysis for irregular column layout 327
12.13 Example of design of flat slab-frame 327
12.13.1 Results of analysis of slab-f rame model 329
12.13.2 Moment distribution due to prestress 329
12.13.3 Cable profile 330
12.14 Calculation of loss of prestress 331
12.14.1 Calculation of loss due to friction and wobble per cable 331
12.14.2 Calculation of loss due to wedge draw-in 333
12.14.3 Calculation of prestress at service 333
12.14.4 Determination of number of cables 333
12.15 Fixed end moments due patch loads and concentrated force and couple 334
12.16 Equivalent loads and fixed end moments 334
12.16.1 Equivalent loads and fixed end moments at transfer 334
12.16.2 Equivalent loads and fixed end moments at service 337
12.16.3 Moment distribution due to equivalent loads at transfer 338
12.16.4 Moment distribution due to equivalent loads at service 340
12.16.5 Moment distribution due to equivalent loads and external loads at transfer 342
12.16.6 Moment distribution due to equivalent loads and external loads at service 342
12.6.7 Stress distribution in the slab at transfer and service stages 343
12.16.8 Moment in end columns 348
12.17 Ultimate limit state moment calculations 348
12.17.1 Moment envelopes 349
12.17.2 Parasitic moments 350
12.17.3 Parasitic moments: example 350
12.17.4 Ultimate moment capacity 351
12.18 Detailing of steel 353
12.19 Eurocode 2 recommendations for detailing of steel 357
12.20 References to Eurocode 2 clauses 357

13. Design for punching shear 359
13.1 Punching shear failure 359
13.2 Punching shear stress calculation 359
13.3 Critical shear perimeter 361
13.4 Effect of holes near the column 363
13.4.1 Example 363
13.5 Columns with capitals 364

13.6 Calculation of punching shear stress v_{ED} under the action of a moment 367
13.7 Punching shear stress under shear force and moment acting simultaneously 369
13.7.1 Special cases of shear force and moment acting together 370
13.8 Punching shear stress checks 371
13.9 Example of punching shear capacity design 373
13.10 Reference to Eurocode 2 clauses 376

14. Loading on buildings 377
14.1 Introduction 377
14.2 Limit states 378
14.3 Classification of actions 379
14.4 Characteristic values of actions 379
14.5 Design values of actions 380
14.6 Combination of actions 381
14.6.1 Combination of actions for ULS 381
14.6.2 Values of γ factors 382
14.6.3 Examples of the use of γ factors 383
14.7 Combination of actions for SLS 389
14.8 References to Eurocode 1 clauses 390

15. Loading on bridges 393
15.1 Introduction 393
15.2 Notional Lanes 393
15.3 Load models 394
15.3.1 Load Model 1 394
15.3.2 Load Model 2 395
15.3.3 Load Model 3 395
15.3.4 Load Model 4 396
15.4 Dispersal of concentrated load 396
15.5 Horizontal forces 396
15.5.1 Breaking forces 396
15.5.2 Centrifugal forces 397
15.6 Loads on footways, cycle tracks and foot bridges 397
15.7 Groups of traffic loads 398
15.8 Combinations of actions for ULS 398
15.9 Values of γ factors 399
15.10 Values of ψ factors for road bridges 399
15.11 Combinations of actions for SLS 399
15.12 References to Eurocode 1 clauses 400

16. Analysis and design of bridge decks 401
16.1 Introduction 401
16.1.1 Balanced Cantilever Construction 402
16.2 Methods of analysis 405
16.3 Grillage analysis 407
16.3.1 Aspects of behaviour ignored in grillage analysis 407
16.3.2 Edge stiffening 409
16.4 Torsional constant 409
16.4.1 Torsional constant of solid sections 411
16.4.2 Torsional constant of thin-walled closed hollow sections 411
16.5 Example of analysis of a beam and slab deck 412
16.5.1 Bending properties of precast beam 412
16.5.2 Section properties of interior composite beam 414
16.5.3 Section properties of end composite beam 416
16.5.4 Torsion constant for composite beam 416
16.5.5 Alternative expressions for approximate value of J for rectangular cross sections 418
16.5.6 Section properties of transverse beams 418
16.5.7 Material properties 419
16.5.8 Calculation of live loads and bending moment distribution in beam elements: SLS 419
16.6 Stresses due to shrinkage of slab 426
16.7 Thermal stresses in the composite beam 426
16.7.1 Thermal stresses: heating 427
16.7.2 Thermal stresses: cooling 429
16.8 Stress distribution at SLS due to external loads 432
16.9 Magnel diagrams 433
16.9.1 Stress checks 437
16.10 Calculation of live loads and bending moment distribution in beam elements: ULS 438
16.11 Self-weight moments 443
16.12 Ultimate moment capacity: Mid-span section 443
16.13 Ultimate shear force 447
16.13.1 Analysis to determine maximum shear force along the span: Cases 1 – 4 448
16.13.2 Analysis to determine maximum shear force along the span: Cases 5 – 8 452
16.13.3 Summary of results 453
16.13.4 Design of shear reinforcement 454
16.14 Design of a post-tensioned box girder bridge 459
16.14.1 Calculation of moments at SLS 461
16.14.2 Thermal stresses: Heating 464
16.14.3 Thermal stresses: Cooling 466
16.14.4 Determination of prestress and eccentricity 467
16.14.5 Stress calculation at SLS 471

16.14.6 Calculation of moments at ULS 474
16.14.7 Calculation of moment capacity at ULS 477
16.14.8 Calculation of shear force at ULS 479
16.14.9 Calculation of twisting moment at ULS 481
16.14.10 Design of shear and torsional reinforcement 483
16.14.11 Longitudinal reinforcement to resist torsion 487
16.14.12 Stress analysis of the deck 487
16.15 Eurocode 2 rules for reinforcement at anchorages 489
16.16 External and internal tendons: A comparison 491
16.17 References to Eurocode 2 clauses 491

17. Lower bound approaches to design at ultimate limit state 493

17.1 Introduction 493
17.2 Theory of Plasticity 493
17.3 In-plane stresses 494
17.3.1 Examples of reinforcement calculations 497
17.3.2 Presence of prestressing cables 503
17.4 Designs for a combination of in-plane and flexural forces 504
17.4.1 Example of design for a combination of in-plane and flexural forces 507
17.5 Criterion for cracking 508
17.6 Out-of-plane shear 510
17.7 Strut and tie method of design 511
17.7.1 B and D Regions 511
17.7.2 Saint Venant's principle 512
17.7.3 An example of strut-tie modelling 514
17.7.4 Design of struts 515
17.7.5 Types of nodal zones 517
17.7.6 Correct layout of struts and ties 520
17.7.6.1 Correct layout of struts and ties: deep beam 520
17.7.6.2 Correct layout of struts and ties: corbel 521
17.7.6.2.1 Code recommendation for design of corbel 523
17.7.6.3 Correct layout of struts and ties: half-joint 525
17.7.6.4 Correct layout of struts and ties: end-block 527
17.7.6.5 Reinforcement at frame corners 529
17.8 Reference to Eurocode 2 clauses 531

18. Design for earthquake resistance 533

18.1 Introduction 533
18.2 Ductility 535
18.3 Types of structural systems 536

18.4 Behaviour factor, q 538
18.5 Ductility classes 540
18.6 A brief introduction to structural dynamics 540
18.6.1 Single-degree-of-freedom system 540
18.6.2 Multi-degree-of-freedom system 542
18.6.3 Response to an acceleration of the base 544
18.6.4 Vibration of an undamped free multi-degree-of-freedom system 545
18.6.5 Calculation of eigenvalues 545
18.6.6 Eigenvectors of [K – ω2 M] 547
18.6.7 Properties of eigenvectors 548
18.6.8 Mode superposition: undamped forced response 549
18.6.9 Mode superposition: damped forced response 550
18.6.10 Mass participation factors and effective mass 550
18.6.10.1 Mass participation factors: Example 551
18.7 Response acceleration spectrum 551
18.7.1 Design elastic response acceleration spectrum 552
18.7.2 Elastic design spectrum: Eurocode 8 553
18.8 Methods of analysis 553
18.8.1 Lateral force method of analysis 554
18.8.1.1 Lateral force method: example 554
18.8.2 Modal response spectrum method of analysis 556
18.8.2.1 Displacement spectrum 557
18.8.2.2 Combining modal values: SRSS and CQC rules 558
18.8.2.3 Rayleigh damping 558
18.8.2.4 'Resultant' storey level displacements 559
18.8.2.5 'Resultant' storey level forces 559
18.9 Combination of seismic action with other actions 560
18.10 Basic principles of conceptual design 561
18.11 Detailing for local ductility: beams 564
18.12 Detailing for local ductility: columns 566
18.13 Design shear force in beams and columns 569
18.14 Design provisions for ductile walls 570
18.16 Reference to Eurocode 8 clauses 571

19. Miscellaneous topics 573
19.1 Introduction 573
19.2 Unbonded design 573
19.3 Design of a post-tensioned box girder 573
19.3.1 Calculation of live loadings at SLS 573
19.3.2 Calculation of total loads at SLS 574
19.3.3 Calculation of bendingm moments at SLS 574
19.3.4 Bending stresses at SLS 575
19.3.5 Thermal stresses: heating and cooling 575

19.4 Determination of prestress 575
19.5 Cracking moment 578
19.6 Ultimate moment capacity 579
19.7 Ultimate shear capacity 580
19.8 Calculation of deflection 582
19.9 References to Eurocode 2 clauses 585

20. References 587
