Preface	xi
Part I Preliminaries	1
1 Motivation: Sensitivity and Large-Scale Systems	3
1.1 Aims and Scope of the Chapter	3
1.2 On System Optimization	3
1.3 On Reliability-Based System Design	6
1.4 On System Identification	11
1.5 On the Stochastic Finite Element Method	13
2 Nonlinear Solid Mechanics: Continuous and Semi-Discretized Formulation	17
2.1 Introductory Comments	17
2.2 Equations of Nonlinear Solid Mechanics	18
2.2.1 Problem Description	18
2.2.2 Strain-Displacement Relations	20
2.2.3 Constitutive Equations	20
2.2.4 Equations of Motion	23
2.2.5 Boundary Conditions	24
2.2.6 Variational Formulation	24
2.3 Constitutive Models for Inelastic Materials	32
2.3.1 Elasto-Plasticity and Elasto-Viscoplasticity	32
2.3.1.1 Linear Elasticity	32
2.3.1.2 Elasto-Plasticity	32
2.3.1.3 Elasto-Viscoplasticity	38
2.3.2 Rigid Plasticity and Rigid Viscoplasticity	43
2.4 The Semi-Discretized Formulation	45
2.5 Remarks on Tensor and Matrix Notation	54
3 Concepts of Sensitivity Analysis for Linear Systems	59
3.1 Introductory Remarks and Notation	59
3.2 Discretized Systems: Statics	64
3.3 Discretized Systems: Dynamics	72
3.4 Distributed Parameter Systems	77
3.4.1 General Comments	77
3.4.2 The Direct Differentiation Method	79
3.4.3 The Adjoint System Method	81
3.5 Shape Sensitivity	84
3.6 Summary of the Chapter	89

Part II	The Sensitivity of Nonlinear Systems	95
4	The Basic Concepts of Nonlinear Quasi-Static Problems at Regular States	97
4.1	The Direct Differentiation Method	97
4.1.1	The Discretized Formulation	97
4.1.2	The Distributed Parameter Formulation	104
4.1.3	On Time Integration of Sensitivity Equations	106
4.1.4	The Total versus Incremental Approach to Nonlinear Elastic Problems	107
4.1.5	Configuration-Dependent Forces	110
4.1.6	The 'Semi-Analytical' Approach	112
4.2	The Adjoint System Method	115
4.2.1	The Adjoint Sensitivity Formulation	115
4.2.2	An Exercise in Using the Variational ASM	118
4.3	Some Illustrative Examples	119
5	Inelastic Systems	127
5.1	Small Deformations: The General 3D Case	127
5.1.1	Theoretical Background	127
5.1.1.1	Linear Elasticity	130
5.1.1.2	Rate-Independent Elasto-Plasticity	131
5.1.1.3	Elasto-Viscoplasticity	148
5.1.2	Some Illustrative Examples	151
5.2	Small Deformations: The Plane Stress Case	162
5.2.1	Theoretical Background	162
5.2.1.1	Linear Elasticity	163
5.2.1.2	Rate-Independent Elasto-Plasticity	163
5.2.1.3	Elasto-Viscoplasticity	170
5.2.2	Some Illustrative Examples	172
5.3	Large Deformations	177
5.3.1	Theoretical Background	177
5.3.2	An Illustrative Example	184
5.4	Conclusions and Remarks on Computer Implementation	189
6	Shape Sensitivity	193
6.1	The Domain Parameterization Approach—Basic Concepts and Notation	193
6.2	The Direct Differentiation Method—DPA/DDM	202
6.3	On Design Parameters Entering the Kinematic Boundary Conditions	209
6.4	The Adjoint System Method—DPA/ASM	212
6.5	Summary of the Chapter	218
7	Buckling and Post-Buckling	219
7.1	Introductory Remarks	219
7.2	On Solving Buckling Problems Using FEM	221
7.3	Sensitivity in Buckling and Post-Buckling Problems	227
7.3.1	Pre-Critical Analysis	227
7.3.2	Critical-Point Analysis	229
7.3.3	Post-Critical Analysis	233

7.4	The Continuum-Based Approach	236
7.5	Numerical Illustrations	238
7.6	Summary of the Chapter	242
8	Nonlinear Dynamics	245
8.1	Problem Statement	245
8.2	The Direct Differentiation Method	248
8.3	The Adjoint System Method	251
8.4	Computational Issues	254
8.5	Numerical Illustrations	256
8.6	Summary of the Chapter	260
9	Metal Forming Using the Flow Approach	263
9.1	Introductory Comments	263
9.2	Discretized Formulation	264
9.2.1	Equations of Flow Approach	264
9.2.2	Boundary Friction	270
9.2.3	Contact and Friction	271
9.2.4	Pressure Stabilization	273
9.2.5	Free Surfaces	275
9.3	Material Parameter Sensitivity	276
9.3.1	Formulation	276
9.3.2	Material Model at Low Effective Strain Rates	282
9.3.3	Analytical Illustrations	283
9.3.3.1	Pure Shear Strain	283
9.3.3.2	Free Forging	284
9.3.4	Computational Illustrations	287
9.3.4.1	Direct Extrusion	287
9.3.4.2	Cutting	293
9.4	Shape Sensitivity for Steady-State Problems	296
9.4.1	General Comments	296
9.4.2	The Domain Parameterization Approach	296
9.4.2.1	Transformation to Reference Configuration	297
9.4.2.2	Design Variation of Problem Variables	298
9.4.2.3	Sensitivity Expressions	299
9.4.3	Discretization	300
9.4.4	Analytical Illustrations	303
9.4.4	Computational Illustrations	305
9.4.5.1	Extrusion	305
9.4.5.2	Rolling	309
9.5	Deep Drawing Problems	313
9.5.1	Formulation	313
9.5.2	Parameter Sensitivity Analysis	320
9.5.3	Computational Illustrations	324
9.6	Summary of the Chapter	328
10	Nonlinear Thermal Systems	331
10.1	Introductory Remarks	331
10.2	Continuum-Based Formulation for Transient Problems	332
10.2.1	On Solving Nonlinear Heat Transfer Problems	332
10.2.2	The Direct Differentiation Method	336
10.2.3	The Adjoint System Method	338

10.3	Semi-Discretized Formulation	341
10.3.1	Finite Element Equations	341
10.3.2	Computational Illustration	350
10.4	Shape Sensitivity for Transient Problems	351
10.4.1	Introduction	351
10.4.2	The Material Derivative Approach—MDA/DDM	352
10.4.3	The Domain Parameterization Approach—DPA/DDM	359
10.4.4	Comparison of Methods	361
10.4.5	The Adjoint System Method	362
10.5	Kirchhoff Transformation in Shape Sensitivity Steady-State Problems	364
10.5.1	Formulation	364
10.5.2	Computational Illustrations	366
10.6	Summary of the Chapter	368
	Appendix A Some Mathematical Background	369
A.1	Concepts from Variational Calculus	369
A.1.1	Fundamental Problem	369
A.1.2	Integral Form of the Euler Equation	373
A.1.3	Variable End-Point Problem	375
A.2	Directional Derivatives	379
A.2.1	The Gâteaux Derivative	379
A.2.2	The Fréchet Derivative	381
	Appendix B Stress and Stress-Rate Measures	383
B.1	Stress Measures	383
B.2	Stress-Rate Measures	386
	References	389
	Index	401
	Glossary of Symbols	403
