## Chapter 1 Finite Element Method for Vibration Analysis of Structures

|           |                                                                                |    |
|-----------|--------------------------------------------------------------------------------|----|
| 1.1       | Introduction                                                                   | 1  |
| 1.2       | The Hamilton Variational Principle for Discrete Systems                        | 2  |
| 1.3       | Finite Element Method for Structural Vibration Analysis                        | 3  |
| 1.4       | The Mechanics Characteristic Matrices of Elements                              | 8  |
| 1.4.1     | Consistent Mass Matrix of a Rod Element                                        | 8  |
| 1.4.2     | Consistent Mass Matrix of a Beam Element                                       | 9  |
| 1.4.3     | Plate Element Vibrating in the Plane                                           | 10 |
| 1.4.4     | Plate Element in Bending Vibration                                             | 12 |
| 1.4.5     | Lumped Mass Modal                                                              | 14 |
| 1.5       | Vibration Eigenproblem of Structures                                           | 14 |
| 1.6       | Orthogonality of Modal Vectors                                                 | 18 |
| 1.7       | The Rayleigh-Ritz Analysis                                                     | 19 |
| 1.8       | The Response to Harmonic Excitation                                            | 21 |
| 1.9       | Response to Arbitrary Excitation                                               | 22 |
| 1.10      | Direct Integration Methods for Vibration Equations                             | 23 |
| 1.10.1    | The Central Difference Method                                                  | 23 |
| 1.10.2    | The Wilson $-\theta$ Method                                                    | 27 |
| 1.10.3    | The Newmark Method                                                             | 30 |
| 1.11      | Direct Integration Approximation and Load Operators in Modal Coordinate System | 32 |
| 1.11.1    | The Central Difference Method                                                  | 33 |
| 1.11.2    | The Wilson $-\theta$ Method                                                    | 34 |
| 1.11.3    | The Newmark Method                                                             | 35 |
| Chapter 2 | Matrix Perturbation Theory for Distinct Eigenvalues                            | 36 |
| 2.1       | Introduction                                                                   | 36 |
| 2.2       | Matrix Perturbation for Distinct Eigenvalues                                   | 36 |
| 2.2.1     | The 1st Order Perturbation                                                     | 38 |
| 2.2.2     | The 2nd Order Perturbation                                                     | 40 |
| 2.2.3     | Computing for the Expansion Coefficients $c_{1i}$ and $c_{2i}$                 | 41 |
| 2.2.4     | Numerical Examples                                                             | 42 |
| 2.3       | The Improvement for Matrix Perturbation                                        | 48 |
| 2.3.1     | The William B. Bickford Method                                                 | 48 |
| 2.3.2     | The Mixed Method of Matrix Perturbation and Rayleigh's Quotient                | 50 |
| 2.3.3     | Numerical Example                                                              | 52 |
| 2.4       | High Accurate Modal Superposition for Derivatives of Modal Vectors             | 54 |
| 2.4.1     | The B. P. Wang Method                                                          | 55 |
| 2.4.2     | High Accurate Modal Superposition                                              | 57 |
| 2.4.3     | Numerical Example                                                              | 59 |
| 2.5       | Mixed Basis Superposition for Eigenvector Perturbation                         | 59 |
| 2.5.1     | Constructing for Mixed-Basis                                                   | 61 |
| 2.5.2     | The 1st Order Perturbation Using Mixed-Basis Expansion                         | 63 |
| 2.5.3     | The 2nd Order Perturbation Using Mixed-Basis Expansion                         | 64 |
| 2.5.4     | Numerical Example                                                              | 65 |

|                  |                                                                                                                             |            |
|------------------|-----------------------------------------------------------------------------------------------------------------------------|------------|
| 2.6              | Eigenvector Derivatives for Free-Free Structures .....                                                                      | 65         |
| 2.6.1            | The Theory Analysis .....                                                                                                   | 65         |
| 2.6.2            | Effect of Eigenvalue Shift $\mu$ on the Convergent Speed .....                                                              | 69         |
| 2.6.3            | Numerical Example .....                                                                                                     | 69         |
| 2.7              | Extracting Modal Parameters of Free-Free Structures from Modes of Constrained Structures Using Matrix Perturbation .....    | 71         |
| 2.8              | Determination of Frequencies and Modes of Free-Free Structures Using Experimental Data for the Constrained Structures ..... | 77         |
| 2.8.1            | Generalized Stiffness, Mass, and the Response to Harmonic Excitation for Free-Free Structures .....                         | 78         |
| 2.8.2            | Przemieniecki's Method (Method 1) .....                                                                                     | 80         |
| 2.8.3            | Chen-Liu Method (Method 2) .....                                                                                            | 82         |
| 2.8.4            | Zhang-Zerva Method (Method 3) .....                                                                                         | 83         |
| 2.8.5            | Further Improvement on Zhang-Zerva Method (Method 4) .....                                                                  | 84         |
| 2.8.6            | Numerical Example .....                                                                                                     | 84         |
| 2.9              | Response Analysis to Harmonic Excitation Using High Accurate Modal Superposition .....                                      | 86         |
| 2.9.1            | High Accurate Modal Superposition (HAMS) .....                                                                              | 88         |
| 2.9.2            | Numerical Examples .....                                                                                                    | 90         |
| 2.9.3            | Extension of High Accurate Modal Superposition .....                                                                        | 91         |
| 2.10             | Sensitivity Analysis of Response Using High Accurate Modal Superposition .....                                              | 94         |
| <b>Chapter 3</b> | <b>Matrix Perturbation Theory for Multiple Eigenvalues</b> .....                                                            | <b>97</b>  |
| 3.1              | Introduction .....                                                                                                          | 97         |
| 3.2              | Matrix Perturbation for Multiple Eigenvalues .....                                                                          | 99         |
| 3.2.1            | Basic Equations .....                                                                                                       | 99         |
| 3.2.2            | Computing for the 1st Order Perturbation of Eigenvalues .....                                                               | 100        |
| 3.2.3            | Computing for the 1st Order Perturbation of Eigenvectors .....                                                              | 100        |
| 3.3              | Approximate Modal Superposition for the 1st Order Perturbation of Eigenvectors of Repeated Eigenvalues .....                | 101        |
| 3.4              | High Accurate Modal Superposition for the 1st Order Perturbation of Eigenvectors of Repeated Eigenvalues .....              | 103        |
| 3.5              | Exact Method for Computing Eigenvector Derivatives of repeated Eigenvalues .....                                            | 105        |
| 3.5.1            | Theoretical Background .....                                                                                                | 106        |
| 3.5.2            | A New Method for Computing $v_i$ .....                                                                                      | 108        |
| 3.5.3            | Numerical Example .....                                                                                                     | 111        |
| 3.6              | Hu's Method for Computing the 1st Order Perturbation of Eigenvectors .....                                                  | 114        |
| 3.6.1            | Hu's Small Parameter Method .....                                                                                           | 114        |
| 3.6.2            | Improved Hu's Method .....                                                                                                  | 116        |
| <b>Chapter 4</b> | <b>Matrix Perturbation Theory for Close Eigenvalues</b> .....                                                               | <b>117</b> |
| 4.1              | Introduction .....                                                                                                          | 117        |
| 4.2              | Behavior of Modes of Close Eigenvalues .....                                                                                | 117        |
| 4.3              | Identification of Modes of Close Eigenvalues .....                                                                          | 120        |
| 4.4              | Matrix Perturbation for Close Eigenvalues .....                                                                             | 122        |
| 4.4.1            | Preliminary Considerations .....                                                                                            | 122        |
| 4.4.2            | Spectral Decomposition of Matrices <b>K</b> and <b>M</b> .....                                                              | 123        |
| 4.4.3            | Matrix Perturbation for Close Eigenvalues .....                                                                             | 123        |

|                  |                                                                                         |            |
|------------------|-----------------------------------------------------------------------------------------|------------|
| 4.5              | Numerical Example .....                                                                 | 128        |
| 4.6              | Derivatives of Modes for Close Eigenvalues .....                                        | 130        |
| <b>Chapter 5</b> | <b>Matrix Perturbation Theory for Complex Modes .....</b>                               | <b>132</b> |
| 5.1              | Introduction .....                                                                      | 132        |
| 5.2              | Basic Equations .....                                                                   | 132        |
| 5.3              | Matrix Perturbation for Distinct Eigenvalues .....                                      | 134        |
| 5.3.1            | Basic Equations of Matrix Perturbation for Complex Modes .....                          | 134        |
| 5.3.2            | The 1st Order Perturbation .....                                                        | 136        |
| 5.3.3            | The 2nd Order Perturbation .....                                                        | 137        |
| 5.3.4            | Computing for Coefficients $C_{ii}^1, D_{ii}^1, C_{ii}^2$ and $D_{ii}^2$ .....          | 138        |
| 5.4              | High Accurate Modal Superposition for Eigenvector Derivatives .....                     | 140        |
| 5.4.1            | Improved Modal Superposition .....                                                      | 141        |
| 5.4.2            | High Accurate Modal Superposition .....                                                 | 143        |
| 5.4.3            | Numerical Example .....                                                                 | 145        |
| 5.5              | Matrix Perturbation for Repeated Eigenvalues of Nondefective Systems .....              | 146        |
| 5.5.1            | Basic Equations .....                                                                   | 146        |
| 5.5.2            | The 1st Order Perturbation of Eigenvalues .....                                         | 148        |
| 5.5.3            | The 1st Order Perturbation of Eigenvectors .....                                        | 148        |
| 5.6              | Matrix Perturbation for Close Eigenvalues .....                                         | 150        |
| 5.6.1            | Spectral Decomposition of Matrices A and B .....                                        | 150        |
| 5.6.2            | Matrix Perturbation for Close Eigenvalues .....                                         | 151        |
| <b>Chapter 6</b> | <b>Matrix Perturbation Theory for Linear Vibration</b>                                  |            |
|                  | <b>Defective Systems .....</b>                                                          | <b>153</b> |
| 6.1              | Introduction .....                                                                      | 153        |
| 6.2              | Generalized Modal Theory of Defective Systems .....                                     | 155        |
| 6.3              | Singular Value Decomposition (SVD) and Eigensolutions .....                             | 156        |
| 6.4              | The SVD Method for Modal Analysis of Defective Systems .....                            | 158        |
| 6.4.1            | Rank Analysis for Identification of Defectiveness .....                                 | 158        |
| 6.4.2            | SVD Method for Identification of Defectiveness and Modal Analysis .....                 | 159        |
| 6.5              | Invariant Subspace Recursive Method for Computing the Generalized Modes .....           | 160        |
| 6.5.1            | Invariant Subspace Recursive Relationship .....                                         | 161        |
| 6.5.2            | SVD and Reductive Method for Computing the Orthogonal Basis of Invariant Subspace ..... | 163        |
| 6.5.3            | Numerical Example .....                                                                 | 167        |
| 6.6              | Matrix Perturbation for Defective Systems .....                                         | 169        |
| 6.6.1            | The Puiseux Expansion for Eigensolutions of Defective Systems .....                     | 169        |
| 6.6.2            | Improved perturbation for Defective Eigenvalues .....                                   | 173        |
| 6.6.3            | Numerical Examples .....                                                                | 176        |
| 6.7              | Matrix Perturbation for Generalized Eigenproblem of Defective Systems .....             | 179        |
| 6.7.1            | Perturbation of Defective Eigenvalues .....                                             | 180        |
| 6.7.2            | Improved Perturbation for Defective Eigenvalues .....                                   | 182        |
| 6.7.3            | Numerical Example .....                                                                 | 185        |
| <b>Chapter 7</b> | <b>Matrix Perturbation Theory for Near Defective Systems .....</b>                      | <b>187</b> |
| 7.1              | Introduction .....                                                                      | 187        |
| 7.2              | Relationship Between Repeated and Close Eigenvalues and Its Identification .....        | 187        |

|                   |                                                                                          |            |
|-------------------|------------------------------------------------------------------------------------------|------------|
| 7.2.1             | Relationship Between Repeated and Close Eigenvalues .....                                | 187        |
| 7.2.2             | Identification for Repeated Eigenvalues .....                                            | 188        |
| 7.2.3             | Identification for Close Eigenvalues .....                                               | 190        |
| 7.3               | Matrix Perturbation for Near Defective Systems .....                                     | 191        |
| 7.3.1             | Matrix Perturbation for Standard Eigenproblem of Near Defective<br>Systems .....         | 191        |
| 7.3.2             | Matrix Perturbation for Generalized Eigenproblem of Near Defective<br>Systems .....      | 194        |
| 7.4               | Numerical Example .....                                                                  | 195        |
| <b>Chapter 8</b>  | <b>Random Eigenvalue Analysis of Structures with Random<br/>Parameters .....</b>         | <b>198</b> |
| 8.1               | Introduction .....                                                                       | 198        |
| 8.2               | Random Finite Element Method for Random Eigenvalue Analysis .....                        | 199        |
| 8.3               | Random Perturbation for Random Eigenvalue Analysis .....                                 | 203        |
| 8.4               | Statistical Properties of Random Eigensolutions .....                                    | 205        |
| 8.5               | Examples .....                                                                           | 208        |
| <b>Chapter 9</b>  | <b>Matrix Perturbation Theory for Interval Eigenproblem ..</b>                           | <b>212</b> |
| 9.1               | Introduction .....                                                                       | 212        |
| 9.2               | Elements of Interval Mathematics .....                                                   | 213        |
| 9.2.1             | Interval Algorithm .....                                                                 | 213        |
| 9.2.2             | Interval Vector and Matrix .....                                                         | 215        |
| 9.2.3             | Interval Extension .....                                                                 | 219        |
| 9.3               | Interval Eigenproblem .....                                                              | 222        |
| 9.4               | The Deif's Method for Interval Eigenvalue Analysis .....                                 | 224        |
| 9.5               | Generalized Deif's Method .....                                                          | 225        |
| 9.6               | Matrix Perturbation for Interval Eigenvalue Analysis Based on the<br>Deif's Method ..... | 227        |
| 9.6.1             | Application of Matrix Perturbation to Interval Eigenvalues .....                         | 227        |
| 9.6.2             | Numerical Example .....                                                                  | 229        |
| 9.7               | Matrix Perturbation for Interval Eigenproblem .....                                      | 231        |
| 9.7.1             | Interval Perturbation Formulation .....                                                  | 232        |
| 9.7.2             | Numerical Example .....                                                                  | 234        |
| <b>References</b> | .....                                                                                    | <b>236</b> |
