Preface.....ix
Author xiii

Chapter 1 Why Do You Need Control Theory?..... 1

1.1 Control is Not Just about Algorithms 1
1.2 The Origins of Simulation.....3
1.3 Discrete Time4
1.4 The Concept of Feedback.....5

Chapter 2 Modelling Time.....9

2.1 Introduction9
2.2 A Simple System9
2.3 Simulation 11
2.4 Choosing a Computing Platform 12

Chapter 3 A Simulation Environment..... 13

3.1 Jollies..... 13
3.2 More on Graphics..... 13
3.3 More Choices 15
3.4 Drawing Graphs 16
3.5 More Details of Jollies 18

Chapter 4 Step Length Considerations 21

4.1 Choosing a Step Length 21
4.2 Discrete Time Solution of a First-Order System 22

Chapter 5 Modelling a Second-Order System 27

5.1 A Servomotor Example 27
5.2 Real-Time Simulation 30

Chapter 6 The Complication of Motor Drive Limits 33

6.1 Drive Saturation..... 33
6.2 The Effect of a Disturbance..... 34
6.3 A Different Visualisation 36
6.4 Meet the Phase Plane..... 37
6.5 In Summary 41

Chapter 7	Practical Controller Design	43
7.1	Overview	43
7.2	The <i>Velodyne</i> Loop	43
7.3	Demand Limitation	44
7.4	Riding a Bicycle	46
7.5	Nested Loops and Pragmatic Control	50
Chapter 8	Adding Dynamics to the Controller	51
8.1	Overview	51
8.2	Noise and Quantisation	53
8.3	Discrete Time Control	54
8.4	Position Control with a Real Motor	56
8.5	In Conclusion	57
Chapter 9	Sensors and Actuators	59
9.1	Introduction	59
9.2	The Nature of Sensors	60
9.3	The Measurement of Position and Displacement	62
9.4	Velocity and Acceleration	64
9.5	Output Devices	64
Chapter 10	Analogue Simulation	67
10.1	History	67
10.2	Analogue Circuitry	67
10.3	State Equations	70
Chapter 11	Matrix State Equations	71
11.1	Introduction	71
11.2	Feedback	73
11.3	A Simpler Approach	74
Chapter 12	Putting It into Practice	77
12.1	Introduction	77
12.2	A Balancing Trolley	78
12.3	Getting Mathematical	83
12.4	Pole Assignment	85
Chapter 13	Observers	87
13.1	Introduction	87
13.2	Laplace and Heaviside	87

13.3	Filters	88
13.4	The Kalman Filter	89
13.5	The Balancing Trolley Example	89
13.6	Complementary Filtering	91
13.7	A Pragmatic Approach	91
Chapter 14	More about the Mathematics	93
14.1	Introduction	93
14.2	How Did the Exponentials Come In?	93
14.3	More about Roots	94
14.4	Imaginary Roots	95
14.5	Complex Roots and Stability	97
Chapter 15	Transfer Functions	99
15.1	Introduction	99
15.2	Phase Advance	100
15.2.1	Mathematical Aside	101
15.3	A Transfer-Function Matrix	101
Chapter 16	Solving the State Equations	105
16.1	Introduction	105
16.2	Vectors and More	106
16.3	Eigenvectors	107
16.4	A General Approach	108
16.5	Equal Roots	108
Chapter 17	Discrete Time and the z Operator	111
17.1	Introduction	111
17.2	Formal Methods	112
17.3	z and Code	114
17.4	Lessons Learned from z	116
17.5	Quantisation	117
17.6	Discrete Transfer Function	118
Chapter 18	Root Locus	119
18.1	Introduction	119
18.2	The Complex Frequency Plane	120
18.3	Poles and Zeroes	121
18.4	A Root Locus Plotter	122
18.5	A Better Plot	122
18.6	Root Locus for Discrete Time	125
18.7	Moving the Controller Poles and Zeroes	128

Chapter 19	More about the Phase Plane	129
19.1	Drawing Phase-Plane Trajectories.....	129
19.2	Phase Plane for Saturating Drive.....	131
19.3	Bang-Bang Control and Sliding Mode.....	134
19.4	More Uses of the Phase Plane.....	135
Chapter 20	Optimisation and an Experiment	137
20.1	Introduction	137
20.2	Time-Optimal Control.....	138
20.3	Predictive Control.....	138
20.4	A Tilting Plank Experiment – Nostalgia	140
20.5	Ball and Beam: A Modern Version.....	140
Chapter 21	Problem Systems	145
21.1	Introduction	145
21.2	A System with a Time Delay.....	145
21.3	Integral Action.....	147
21.4	The Bathroom Shower Approach	148
Chapter 22	Final Comments	149
22.1	Introduction	149
22.2	Multi-Rate Systems	149
22.3	Motor Control with a Two-Phase Encoder.....	150
22.4	And Finally.....	151
Now Read On		153
Index		159
