

CONTENTS

Preface	13
Historical background	15
1. Mode interaction buckling in thin-walled bar members	19
1.1. Introduction	19
1.2. Phenomenon of mode interaction	19
1.3. Theoretical background	28
1.3.1. Selective review	28
1.3.2. Van der Neut model	31
1.3.3. Erosion of Critical Bifurcation Load – ECBL	33
1.3.4. Plastic-elastic interactive buckling via ECBL approach	40
1.3.5. Erosion of buckling strength due to the influence of the shape of sectional geometrical imperfections	45
1.3.6. Imperfection sensitivity analysis of perforated pallet rack uprights	48
1.4. Timisoara steel structures stability research school: relevant contributions	57
1.5. Concluding remarks	63
1.6. References	63
2. Static and dynamic behaviour of thin-walled structures with stiffeners under axial compression – a review	69
2.1. Structural problems and its solutions	73
2.2. Thin-walled reinforced columns of closed cross-sections	78
2.3. Thin-walled reinforced columns of open cross-sections	82
2.4. Final remarks	85
2.5. References	86
3. Problems of circular and annular plates in nonlinear aspect Works of academics of the Department of Fundamentals of Mechanical Engineering in Bielsko-Biala	95
3.1. Introduction	95
3.2. Theoretical bases	96
3.2.1. General remarks	96
3.2.2. Equilibrium equations	97
3.2.3. Geometrical relationships	98
3.2.4. Physical conditions	98
3.2.5. Edge conditions	98
3.2.6. Solution methods	98
3.3. The problems of large deflections of circular and annular plates loaded with forces	99
3.3.1. Asymmetrical bending of orthotropic circular plate in nonlinear aspect	99
3.3.2. Annular plate with the preliminary deflection in the form of cone with the small elevation	101
3.3.3. Theoretical and experimental approximate analysis of the large deflections of annular plates	103

3.4. Thermal loading	105
3.4.1. Stability of orthotropic annular plate in the stationary temperature field	105
3.5. Dynamic stability of annular plates subjected to forces or temperature fields variable in time	107
3.5.1. Annular, cylindrically orthotropic plate subjected to pressure variable in time	108
3.5.2. The stability of annular plates on elastic foundation in non-linear aspect	111
3.5.3. The behaviour of homogeneous, viscoelastic, annular plates under lateral variable loads	113
3.5.4. Dynamic stability of three-layered annular plates with elastic and viscoelastic core	115
3.6. Conclusion	120
3.7. References	120
4. Stability of thin-walled structures accounting for initial imperfections and clearances	127
4.1. Introduction	127
4.2. Initial geometric imperfections	131
4.2.1. Stability of perfect and imperfect structures	131
4.2.2. Engineering methods taking into account geometric imperfections	131
4.2.3. Manufacturing tolerances in design codes	133
4.2.4. Nonlinear numerical analysis	134
4.3. Clearances in bar structures	136
4.3.1. Engineering aspects of clearances	136
4.3.2. Linear and nonlinear stability analysis	136
4.4. Initial imperfections combined with clearances	139
4.5. Concluding remarks	143
4.6. References	143
5. Oscillations of viscoelastic Timoshenko beam with dynamic vibration absorber and concentrated masses	147
5.1. Introduction	147
5.2. Governing equations	148
5.2.1. Differential equations of viscoelastic Timoshenko beam with dynamical vibration absorber and concentrated masses	148
5.3. Dimensionless equations	151
5.4. Harmonic oscillations of the beam with dynamic vibration absorber	153
5.4.1. Absorber's dynamic amplification factor	154
5.4.2. Equation for harmonically oscillating Timoshenko beam with absorber	154
5.5. Solution by expansion in eigenmodes of elastic E-B beam without absorber	156
5.5.1. Forced oscillations	156
5.5.2. Free oscillations	158
5.6. Simply supported Timoshenko beam	160

5.6.1. Forced oscillations	160
5.6.2. Free oscillations	161
5.7. Solution in one-mode approximation	162
5.8. Results of numerical analysis	164
5.8.1. The influence of beam parameters on the first natural frequency	165
5.8.2. The influence of beam and absorber parameters on frequency-response curves	167
5.8.3. Multi-mode solution. Running waves	174
5.9. Conclusions	176
5.10. References	177
6. Effect of initial imperfections on buckling of thin-walled I columns	179
6.1. Introduction	179
6.2. Effect of initial curvature on torsional buckling	180
6.2.1. Strain state of I column	180
6.2.2. Governing differential equations	181
6.2.3. Critical torsional buckling load - analytical solution	182
6.2.4. Finite element analysis	184
6.2.5. Numerical examples	185
6.2.6. Conclusions	187
6.3. Effect of initial twist angle on flexural buckling	188
6.3.1. Strain state of I column	188
6.3.2. Governing differential equations	189
6.3.3. Critical torsional buckling load - analytical solution	190
6.3.4. Finite element analysis	192
6.3.5. Numerical examples	193
6.3.6. Conclusions	194
6.4. Final conclusions	195
6.5. References	195
7. Static and global stability analysis of thin-walled structures in finite element method formulation	197
7.1. Introduction	197
7.2. FE incremental equilibrium equations	198
7.2.1. Variational equilibrium equation	198
7.2.2. FE incremental equilibrium equation of the structure	201
7.3. Buckling analysis	202
7.4. Thin-walled beam element	203
7.5. Shell-beam FE models	207
7.5.1. Transition finite element	207
7.5.2. Space joint element	209
7.6. Examples	215
7.6.1. Static analysis of cantilever channel section beam	215
7.6.2. Static analysis of right angle frame	216
7.6.3. Buckling analysis of three-beam frame	219
7.6.4. Large displacements of portal frame	220
7.7. Summary	222

7.8. References	222
8. Shearing effect of elastic sandwich structures with corrugated core	224
8.1. Introduction	224
8.2. Analytical model of sandwich structures	225
8.2.1. Elastic constants for corrugated core	225
8.2.2. Sandwich beams	227
8.2.3. Sandwich rectangular plate	229
8.3. Bending of elastic sandwich structures	231
8.3.1. Sandwich beams	231
8.3.2. Sandwich rectangular plate	232
8.4. Bending of elastic sandwich structures	233
8.4.1. Sandwich beams	233
8.4.2. Sandwich rectangular plate	234
8.5. Concluding remarks	236
8.6. References	236
9. Behaviour of eccentrically loaded stainless steel columns with variation in mechanical properties	241
9.1. Introduction	241
9.2. Mechanical properties of cold formed stainless steel lipped channel sections	242
9.3. Stress-strain behaviour far beyond yield	244
9.4. Load capacity of stainless steel lipped channel section columns subjected to combined bending and axial compression loading	245
9.5. Polish Code PN-90/B-03200, Section 4	247
9.6. Finite element analysis	248
9.7. Experimental investigations	250
9.7.1. Tensile tests	250
9.7.2. Compression tests	251
9.8. Results	252
9.8.1. Tensile tests	252
9.8.2. Compression tests	257
9.8.2. Finite element analysis	260
9.9. Observations	261
9.10. Conclusions	264
9.11. References	265
10. A special problem of plate buckling – tension buckling of a plate having a hole	267
10.1. Tension buckling problem	267
10.2. Basic concept	268
10.2.1. General	268
10.2.2. Definitions	271
10.3. Elastic buckling behaviour as an eigenvalue problem	272
10.3.1. Eigenvalue and the tension buckling problem	272
10.3.2. Buckling behaviour	273
10.3.3. Buckling coefficients	274

10.3.4. Euler curves	277
10.4. Elasto-plastic large deflection behaviour	278
10.4.1. Out-of-plane deflection and tension buckling	278
10.4.2. Load-deflection relations of tension buckling	279
10.4.3. Magnitude of initial deflection	280
10.4.4. Initial deflection patterns	282
10.4.5. Effect of loading width	283
10.4.6. Effect of hole shape	285
10.4.7. Strength curve (Euler curve)	286
10.5. Remarks	287
10.6. References	288
11. «Static resonance» in cylindrical shells with periodical non-uniform strain-stress state conditioned by load or initial imperfections	289
11.1. Problem short overview	289
11.2. Numerical research of the shells undergoing non-uniform compression	294
11.2.1. General considerations	294
11.2.2. Research technique	294
11.2.3. Prebuckling deformation	296
11.2.4. Critical and limit loads	297
11.2.5. Eigenvibration modes	299
11.2.6. Research result discussion	299
11.2.7. Deformation energy of the shells undergoing periodical non-uniform axial compression	302
11.3. Shells with initial geometrical imperfections	303
11.3.1. General overview	303
11.3.2. Research technique	304
11.3.3. Research results	306
11.3.4. Deformation energy of the shells with initial geometrical imperfections	308
11.4. Conclusions	309
11.5. References	310
12. Stability of shells in elastic-plastic state of stress	313
12.1. Introduction	314
12.2. Stability of a thin cylindrical shell beyond the elastic limit	321
12.3. Stability of an elastic-plastic conical shell	326
12.4. References	334
13. On the mass discretization in the free vibration analysis for unbounded periodically inhomogeneous shells	337
13.1. Object of analysis	337
13.2. Mass discretization models	338
13.2.1. Case 1	339
13.2.2. Case 2	340
13.2.3. Case 3	341
13.3. Equations of motion	342
13.3.1. Case 1	342

13.3.2. Case 2	342
13.3.3. Case 3	343
13.4. Free vibrations of the shell	344
13.4.1. Uniform mass discretization	344
13.4.2. Non - uniform mass discretization	345
13.5. Summary of results	346
13.6. References	347
14. Dynamic modelling of the longitudinally graded rectangular thin plates	348
14.1. Introduction	348
14.2. Direct description of composite plates	350
14.3. Modelling procedures	351
14.4. Averaging description	353
14.5. Applications	356
14.5.1. Structural model equations for a rectangular plate	356
14.5.2. Asymptotic model equations for a rectangular plate	357
14.5.3. The numerical examples	358
14.6. The conclusions	363
14.7. References	363
15. On a modelling of heat conduction in the longitudinally graded conductor	365
15.1. Introduction	365
15.2. Fundamental equations	367
15.3. Modelling procedures	369
15.4. Model equations	370
15.5. Applications	371
15.5.1. Steady state	374
15.5.2. Transient state	377
15.5.3. Numeric calculations	379
15.6. Conclusions	380
15.7. References	381
16. Experimental and numerical study of the impact of blast wave created by explosive charge on the steel plate	383
16.1. Introduction	383
16.2. The analytical methods for the determination of the load	383
16.3. Objects of research	384
16.4. The results of experimental studies	386
16.5. Numerical research	389
16.5.1. The formulation of the physical model	389
16.5.2. Description of the numerical model	390
16.5.3. The results of numerical analysis	392
16.6. Summary	398
16.7. References	398
List of authors and participants	400
Organising committee members list	410
