Abbreviations	xv		
Preface to the second edition	xvii		
Organic chemistry and this book	xix		
<b>1 What is organic chemistry?</b>	<b>1</b>	<b>4 Structure of molecules</b>	<b>80</b>
Organic chemistry and you	1	Introduction	80
Organic compounds	2	Electrons occupy atomic orbitals	83
Organic chemistry and industry	6	Molecular orbitals—diatomic molecules	88
Organic chemistry and the periodic table	11	Bonds between different atoms	95
Organic chemistry and this book	13	Hybridization of atomic orbitals	99
Further reading	13	Rotation and rigidity	105
		Conclusion	106
		Looking forward	106
		Further reading	106
<b>2 Organic structures</b>	<b>15</b>	<b>5 Organic reactions</b>	<b>107</b>
Hydrocarbon frameworks and functional groups	16	Chemical reactions	107
Drawing molecules	17	Nucleophiles and electrophiles	111
Hydrocarbon frameworks	22	Curly arrows represent reaction mechanisms	116
Functional groups	27	Drawing your own mechanisms with curly arrows	120
Carbon atoms carrying functional groups can be classified by oxidation level	32	Further reading	124
Naming compounds	33		
What do chemists really call compounds?	36	<b>6 Nucleophilic addition to the carbonyl group</b>	<b>125</b>
How should you name compounds?	40	Molecular orbitals explain the reactivity of the carbonyl group	125
Further reading	42	Attack of cyanide on aldehydes and ketones	127
		The angle of nucleophilic attack on aldehydes and ketones	129
<b>3 Determining organic structures</b>	<b>43</b>	Nucleophilic attack by 'hydride' on aldehydes and ketones	130
Introduction	43	Addition of organometallic reagents to aldehydes and ketones	132
Mass spectrometry	46	Addition of water to aldehydes and ketones	133
Mass spectrometry detects isotopes	48	Hemiacetals from reaction of alcohols with aldehydes and ketones	135
Atomic composition can be determined by high-resolution mass spectrometry	50	Ketones also form hemiacetals	137
Nuclear magnetic resonance	52	Acid and base catalysis of hemiacetal and hydrate formation	137
Regions of the $^{13}\text{C}$ NMR spectrum	56	Bisulfite addition compounds	138
Different ways of describing chemical shift	57	Further reading	140
A guided tour of the $^{13}\text{C}$ NMR spectra of some simple molecules	57		
The $^1\text{H}$ NMR spectrum	59	<b>7 Delocalization and conjugation</b>	<b>141</b>
Infrared spectra	63	Introduction	141
Mass spectra, NMR, and IR combined make quick identification possible	72	The structure of ethene (ethylene, $\text{CH}_2=\text{CH}_2$ )	142
Double bond equivalents help in the search for a structure	74	Molecules with more than one $\text{C}=\text{C}$ double bond	143
Looking forward to Chapters 13 and 18	78		
Further reading	78		

The conjugation of two $\pi$ bonds	146	And to conclude...	220
UV and visible spectra	148	Further reading	220
The allyl system	150		
Delocalization over three atoms is a common structural feature	154	<b>11 Nucleophilic substitution at C=O with loss of carbonyl oxygen</b>	<b>222</b>
Aromaticity	156	Introduction	222
Further reading	162	Aldehydes can react with alcohols to form hemiacetals	223
		Acetals are formed from aldehydes or ketones plus alcohols in the presence of acid	224
<b>8 Acidity, basicity, and <math>pK_a</math></b>	<b>163</b>	Amines react with carbonyl compounds	229
Organic compounds are more soluble in water as ions	163	Imines are the nitrogen analogues of carbonyl compounds	230
Acids, bases, and $pK_a$	165	Summary	238
Acidity	165	Further reading	239
The definition of $pK_a$	168		
Constructing a $pK_a$ scale	171	<b>12 Equilibria, rates, and mechanisms</b>	<b>240</b>
Nitrogen compounds as acids and bases	174	How far and how fast?	240
Substituents affect the $pK_a$	175	How to make the equilibrium favour the product you want	244
Carbon acids	176	Entropy is important in determining equilibrium constants	246
$pK_a$ in action—the development of the drug cimetidine	178	Equilibrium constants vary with temperature	248
Lewis acids and bases	180	Introducing kinetics: how to make reactions go faster and cleaner	250
Further reading	181	Rate equations	257
		Catalysis in carbonyl substitution reactions	262
<b>9 Using organometallic reagents to make C–C bonds</b>	<b>182</b>	Kinetic versus thermodynamic products	264
Introduction	182	Summary of mechanisms from Chapters 6–12	266
Organometallic compounds contain a carbon–metal bond	183	Further reading	267
Making organometallics	184		
Using organometallics to make organic molecules	189	<b>13 <math>^1\text{H}</math> NMR: Proton nuclear magnetic resonance</b>	<b>269</b>
Oxidation of alcohols	194	The differences between carbon and proton NMR	269
Looking forward	196	Integration tells us the number of hydrogen atoms in each peak	270
Further reading	196	Regions of the proton NMR spectrum	272
		Protons on saturated carbon atoms	272
<b>10 Nucleophilic substitution at the carbonyl group</b>	<b>197</b>	The alkene region and the benzene region	277
The product of nucleophilic addition to a carbonyl group is not always a stable compound	197	The aldehyde region: unsaturated carbon bonded to oxygen	281
Carboxylic acid derivatives	198	Protons on heteroatoms have more variable shifts than protons on carbon	282
Why are the tetrahedral intermediates unstable?	200	Coupling in the proton NMR spectrum	285
Not all carboxylic acid derivatives are equally reactive	205	To conclude	301
Acid catalysts increase the reactivity of a carbonyl group	207	Further reading	301
Acid chlorides can be made from carboxylic acids using $\text{SOCl}_2$ or $\text{PCl}_5$	214		
Making other compounds by substitution reactions of acid derivatives	216	<b>14 Stereochemistry</b>	<b>302</b>
Making ketones from esters: the problem	216	Some compounds can exist as a pair of mirror-image forms	302
Making ketones from esters: the solution	218		
To summarize...	220		

Diastereoisomers are stereoisomers that are not enantiomers	311
Chiral compounds with no stereogenic centres	319
Axes and centres of symmetry	320
Separating enantiomers is called resolution	322
Further reading	327

## 15 Nucleophilic substitution at saturated carbon 328

Mechanisms for nucleophilic substitution	328
How can we decide which mechanism ( $S_N1$ or $S_N2$ ) will apply to a given organic compound?	332
A closer look at the $S_N1$ reaction	333
A closer look at the $S_N2$ reaction	340
Contrasts between $S_N1$ and $S_N2$	342
The leaving group in $S_N1$ and $S_N2$ reactions	347
The nucleophile in $S_N1$ reactions	352
The nucleophile in the $S_N2$ reaction	353
Nucleophiles and leaving groups compared	357
Looking forward: elimination and rearrangement reactions	358
Further reading	359

## 16 Conformational analysis 360

Bond rotation allows chains of atoms to adopt a number of conformations	360
Conformation and configuration	361
Barriers to rotation	362
Conformations of ethane	363
Conformations of propane	365
Conformations of butane	365
Ring strain	366
A closer look at cyclohexane	370
Substituted cyclohexanes	374
To conclude...	381
Further reading	381

## 17 Elimination reactions 382

Substitution and elimination	382
How the nucleophile affects elimination versus substitution	384
E1 and E2 mechanisms	386
Substrate structure may allow E1	388
The role of the leaving group	390
E1 reactions can be stereoselective	391
E2 eliminations have anti-periplanar transition states	395
The regioselectivity of E2 eliminations	398

Anion-stabilizing groups allow another mechanism—E1cB	399
To conclude	404
Further reading	406

## 18 Review of spectroscopic methods 407

There are three reasons for this chapter	407
Spectroscopy and carbonyl chemistry	408
Acid derivatives are best distinguished by infrared	411
Small rings introduce strain inside the ring and higher s character outside it	412
Simple calculations of C=O stretching frequencies in IR spectra	413
NMR spectra of alkynes and small rings	414
Proton NMR distinguishes axial and equatorial protons in cyclohexanes	415
Interactions between different nuclei can give enormous coupling constants	415
Identifying products spectroscopically	418
Tables	422
Shifts in proton NMR are easier to calculate and more informative than those in carbon NMR	425
Further reading	426

## 19 Electrophilic addition to alkenes 427

Alkenes react with bromine	427
Oxidation of alkenes to form epoxides	429
Electrophilic addition to unsymmetrical alkenes is regioselective	433
Electrophilic addition to dienes	435
Unsymmetrical bromonium ions open regioselectively	436
Electrophilic additions to alkenes can be stereospecific	439
Adding two hydroxyl groups: dihydroxylation	442
Breaking a double bond completely: periodate cleavage and ozonolysis	443
Adding one hydroxyl group: how to add water across a double bond	444
To conclude... a synopsis of electrophilic addition reactions	447
Further reading	447

## 20 Formation and reactions of enols and enolates 449

Would you accept a mixture of compounds as a pure substance?	449
Tautomerism: formation of enols by proton transfer	450
Why don't simple aldehydes and ketones exist as enols?	451

Evidence for the equilibration of carbonyl compounds with enols	451	To conclude...	526
Enolization is catalysed by acids and bases	452	Further reading	527
The intermediate in the base-catalysed reaction is an enolate ion	452	<b>23 Chemoselectivity and protecting groups</b>	<b>528</b>
Summary of types of enol and enolate	454	Selectivity	528
Stable enols	456	Reducing agents	530
Consequences of enolization	459	Reduction of carbonyl groups	530
Reaction with enols or enolates as intermediates	460	Hydrogen as a reducing agent: catalytic hydrogenation	534
Stable equivalents of enolate ions	465	Getting rid of functional groups	539
Enol and enolate reactions at oxygen: preparation of enol ethers	467	Dissolving metal reductions	541
Reactions of enol ethers	468	Selectivity in oxidation reactions	544
To conclude	470	Competing reactivity: choosing which group reacts	546
Further reading	470	A survey of protecting groups	549
		Further reading	561
<b>21 Electrophilic aromatic substitution</b>	<b>471</b>	<b>24 Regioselectivity</b>	<b>562</b>
Introduction: enols and phenols	471	Introduction	562
Benzene and its reactions with electrophiles	473	Regioselectivity in electrophilic aromatic substitution	563
Electrophilic substitution on phenols	479	Electrophilic attack on alkenes	570
A nitrogen lone pair activates even more strongly	482	Regioselectivity in radical reactions	571
Alkyl benzenes also react at the <i>ortho</i> and <i>para</i> positions	484	Nucleophilic attack on allylic compounds	574
Electron-withdrawing substituents give <i>meta</i> products	486	Electrophilic attack on conjugated dienes	579
Halogens show evidence of both electron withdrawal and donation	489	Conjugate addition	581
Two or more substituents may cooperate or compete	491	Regioselectivity in action	582
Some problems and some opportunities	492	Further reading	583
A closer look at Friedel–Crafts chemistry	492	<b>25 Alkylation of enolates</b>	<b>584</b>
Exploiting the chemistry of the nitro group	494	Carbonyl groups show diverse reactivity	584
Summary	495	Some important considerations that affect all alkylations	584
Further reading	497	Nitriles and nitroalkanes can be alkylated	585
		Choice of electrophile for alkylation	587
<b>22 Conjugate addition and nucleophilic aromatic substitution</b>	<b>498</b>	Lithium enolates of carbonyl compounds	587
Alkenes conjugated with carbonyl groups	498	Alkylations of lithium enolates	588
Conjugated alkenes can be electrophilic	499	Using specific enol equivalents to alkylate aldehydes and ketones	591
Summary: factors controlling conjugate addition	509	Alkylation of $\beta$ -dicarbonyl compounds	595
Extending the reaction to other electron-deficient alkenes	510	Ketone alkylation poses a problem in regioselectivity	598
Conjugate substitution reactions	511	Enones provide a solution to regioselectivity problems	601
Nucleophilic epoxidation	513	Using Michael acceptors as electrophiles	605
Nucleophilic aromatic substitution	514	To conclude...	612
The addition–elimination mechanism	515	Further reading	613
The $S_N1$ mechanism for nucleophilic aromatic substitution: diazonium compounds	520	<b>26 Reactions of enolates with carbonyl compounds: the aldol and Claisen reactions</b>	<b>614</b>
The benzyne mechanism	523	Introduction	614
		The aldol reaction	615
		Cross-condensations	618

Specific enol equivalents can be used to control aldol reactions	624
How to control aldol reactions of esters	631
How to control aldol reactions of aldehydes	632
How to control aldol reactions of ketones	634
Intramolecular aldol reactions	636
Acylation at carbon	640
Crossed ester condensations	643
Summary of the preparation of keto-esters by the Claisen reaction	647
Controlling acylation with specific enol equivalents	648
Intramolecular crossed Claisen ester condensations	652
Carbonyl chemistry—where next?	654
Further reading	654

## 27 Sulfur, silicon, and phosphorus in organic chemistry

656

Useful main group elements	656
Sulfur: an element of contradictions	656
Sulfur-stabilized anions	660
Sulfonium salts	664
Sulfonium ylids	665
Silicon and carbon compared	668
Allyl silanes as nucleophiles	675
The selective synthesis of alkenes	677
The properties of alkenes depend on their geometry	677
Exploiting cyclic compounds	678
Equilibration of alkenes	679
<i>E</i> and <i>Z</i> alkenes can be made by stereoselective addition to alkynes	681
Predominantly <i>E</i> alkenes can be formed by stereoselective elimination reactions	684
The Julia olefination is regioselective and connective	686
Stereospecific eliminations can give pure single isomers of alkenes	688
Perhaps the most important way of making alkenes—the Wittig reaction	689
To conclude	693
Further reading	693

## 28 Retrosynthetic analysis

694

Creative chemistry	694
Retrosynthetic analysis: synthesis backwards	694
Disconnections must correspond to known, reliable reactions	695
Synthons are idealized reagents	695
Multiple step syntheses: avoid chemoselectivity problems	698

Functional group interconversion	699
Two-group disconnections are better than one-group disconnections	702
C—C disconnections	706
Available starting materials	711
Donor and acceptor synthons	712
Two-group C—C disconnections	712
1,5-Related functional groups	719
'Natural reactivity' and 'umpolung'	719
To conclude...	722
Further reading	722

## 29 Aromatic heterocycles 1: reactions

723

Introduction	723
Aromaticity survives when parts of benzene's ring are replaced by nitrogen atoms	724
Pyridine is a very unreactive aromatic imine	725
Six-membered aromatic heterocycles can have oxygen in the ring	732
Five-membered aromatic heterocycles are good at electrophilic substitution	733
Furan and thiophene are oxygen and sulfur analogues of pyrrole	735
More reactions of five-membered heterocycles	738
Five-membered rings with two or more nitrogen atoms	740
Benzo-fused heterocycles	745
Putting more nitrogen atoms in a six-membered ring	748
Fusing rings to pyridines: quinolines and isoquinolines	749
Aromatic heterocycles can have many nitrogens but only one sulfur or oxygen in any ring	751
There are thousands more heterocycles out there	753
Which heterocyclic structures should you learn?	754
Further reading	755

## 30 Aromatic heterocycles 2: synthesis

757

Thermodynamics is on our side	758
Disconnect the carbon—heteroatom bonds first	758
Pyrroles, thiophenes, and furans from 1,4-dicarbonyl compounds	760
How to make pyridines: the Hantzsch pyridine synthesis	763
Pyrazoles and pyridazines from hydrazine and dicarbonyl compounds	767
Pyrimidines can be made from 1,3-dicarbonyl compounds and amidines	770
Unsymmetrical nucleophiles lead to selectivity questions	771
Isoxazoles are made from hydroxylamine or by cycloaddition	772
Tetrazoles and triazoles are also made by cycloadditions	774
The Fischer indole synthesis	775

Quinolines and isoquinolines	780	The Woodward–Hoffmann description of the Diels–Alder reaction	892
More heteroatoms in fused rings mean more choice in synthesis	784	Trapping reactive intermediates by cycloadditions	893
Summary: the three major approaches to the synthesis of aromatic heterocycles	785	Other thermal cycloadditions	894
Further reading	788	Photochemical [2 + 2] cycloadditions	896
		Thermal [2 + 2] cycloadditions	898
		Making five-membered rings: 1,3-dipolar cycloadditions	901
		Two very important synthetic reactions: cycloaddition of alkenes with osmium tetroxide and with ozone	905
		Summary of cycloaddition reactions	907
		Further reading	908
<b>31 Saturated heterocycles and stereoelectronics</b>	<b>789</b>		
Introduction	789	<b>35 Pericyclic reactions 2: sigmatropic and electrocyclic reactions</b>	<b>909</b>
Reactions of saturated heterocycles	790	Sigmatropic rearrangements	909
Conformation of saturated heterocycles	796	Orbital descriptions of [3,3]-sigmatropic rearrangements	912
Making heterocycles: ring-closing reactions	805	The direction of [3,3]-sigmatropic rearrangements	913
Ring size and NMR	814	[2,3]-Sigmatropic rearrangements	917
Geminal ( $^2J$ ) coupling	817	[1,5]-Sigmatropic hydrogen shifts	919
Diastereotopic groups	820	Electrocyclic reactions	922
To summarize...	824	Further reading	930
Further reading	824		
<b>32 Stereoselectivity in cyclic molecules</b>	<b>825</b>		
Introduction	825	<b>36 Participation, rearrangement, and fragmentation</b>	<b>931</b>
Stereochemical control in six-membered rings	826	Neighbouring groups can accelerate substitution reactions	931
Reactions on small rings	832	Rearrangements occur when a participating group ends up bonded to a different atom	937
Regiochemical control in cyclohexene epoxides	836	Carbocations readily rearrange	940
Stereoselectivity in bicyclic compounds	839	The pinacol rearrangement	945
Fused bicyclic compounds	841	The dienone-phenol rearrangement	949
Spirocyclic compounds	846	The benzilic acid rearrangement	950
Reactions with cyclic intermediates or cyclic transition states	847	The Favorskii rearrangement	950
To summarize...	851	Migration to oxygen: the Baeyer–Villiger reaction	953
Further reading	851	The Beckmann rearrangement	958
		Polarization of C–C bonds helps fragmentation	960
		Fragmentations are controlled by stereochemistry	962
		Ring expansion by fragmentation	963
		Controlling double bonds using fragmentation	965
		The synthesis of nootkatone: fragmentation showcase	966
		Looking forward	969
		Further reading	969
<b>33 Diastereoselectivity</b>	<b>852</b>		
Looking back	852	<b>37 Radical reactions</b>	<b>970</b>
Prochirality	856	Radicals contain unpaired electrons	970
Additions to carbonyl groups can be diastereoselective even without rings	858	Radicals form by homolysis of weak bonds	971
Stereoselective reactions of acyclic alkenes	865		
Aldol reactions can be stereoselective	868		
Single enantiomers from diastereoselective reactions	871		
Looking forward	876		
Further reading	876		
<b>34 Pericyclic reactions 1: cycloadditions</b>	<b>877</b>		
A new sort of reaction	877		
General description of the Diels–Alder reaction	879		
The frontier orbital description of cycloadditions	886		
Regioselectivity in Diels–Alder reactions	889		

Most radicals are extremely reactive. . .	974	Summary of methods for the investigation of mechanism	1067
How to analyse the structure of radicals: electron spin resonance	975	Further reading	1068
Radical stability	977		
How do radicals react?	980	<b>40 Organometallic chemistry</b>	<b>1069</b>
Radical–radical reactions	980	Transition metals extend the range of organic reactions	1069
Radical chain reactions	984	The 18 electron rule	1070
Chlorination of alkanes	986	Bonding and reactions in transition metal complexes	1073
Allylic bromination	989	Palladium is the most widely used metal in homogeneous catalysis	1078
Reversing the selectivity: radical substitution of Br by H	990	The Heck reaction couples together an organic halide or triflate and an alkene	1079
Carbon–carbon bond formation with radicals	992	Cross-coupling of organometallics and halides	1082
The reactivity pattern of radicals is quite different from that of polar reagents	997	Allylic electrophiles are activated by palladium(0)	1088
Alkyl radicals from boranes and oxygen	998	Palladium-catalysed amination of aromatic rings	1092
Intramolecular radical reactions are more efficient than intermolecular ones	999	Alkenes coordinated to palladium(II) are attacked by nucleophiles	1096
Looking forward	1002	Palladium catalysis in the total synthesis of a natural alkaloid	1098
Further reading	1002	An overview of some other transition metals	1099
		Further reading	1101
<b>38 Synthesis and reactions of carbenes</b>	<b>1003</b>	<b>41 Asymmetric synthesis</b>	<b>1102</b>
Diazomethane makes methyl esters from carboxylic acids	1003	Nature is asymmetric	1102
Photolysis of diazomethane produces a carbene	1005	The chiral pool: Nature's chiral centres 'off the shelf'	1104
How do we know that carbenes exist?	1006	Resolution can be used to separate enantiomers	1106
Ways to make carbenes	1006	Chiral auxiliaries	1107
Carbenes can be divided into two types	1010	Chiral reagents	1113
How do carbenes react?	1013	Asymmetric catalysis	1114
Carbenes react with alkenes to give cyclopropanes	1013	Asymmetric formation of carbon–carbon bonds	1126
Insertion into C–H bonds	1018	Asymmetric aldol reactions	1129
Rearrangement reactions	1020	Enzymes as catalysts	1132
Nitrenes are the nitrogen analogues of carbenes	1022	Further reading	1133
Alkene metathesis	1023		
Summary	1027	<b>42 Organic chemistry of life</b>	<b>1134</b>
Further reading	1027	Primary metabolism	1134
		Life begins with nucleic acids	1135
<b>39 Determining reaction mechanisms</b>	<b>1029</b>	Proteins are made of amino acids	1139
There are mechanisms and there are mechanisms	1029	Sugars—just energy sources?	1142
Determining reaction mechanisms: the Cannizzaro reaction	1031	Lipids	1147
Be sure of the structure of the product	1035	Mechanisms in biological chemistry	1149
Systematic structural variation	1040	Natural products	1156
The Hammett relationship	1041	Fatty acids and other polyketides are made from acetyl CoA	1161
Other kinetic evidence for reaction mechanisms	1050	Terpenes are volatile constituents of plants	1164
Acid and base catalysis	1053	Further reading	1167
The detection of intermediates	1060		
Stereochemistry and mechanism	1063		

<b>43</b>	<b>Organic chemistry today</b>	<b>1169</b>	Figure acknowledgements	1182
	Science advances through interaction between disciplines	1169	Periodic table of the elements	1184
	Chemistry vs viruses	1170	Index	1187
	The future of organic chemistry	1179		
	Further reading	1181
