

CONTENTS OF VOLUME 1

Preface	v
 Chapter 1	
N. C. Billingham and A. D. Jenkins, The principles and methods of polymer preparation	1
1. Introduction and basic definitions	2
1.1. Double-bond polymerization (addition or chain-reaction polymerization)	5
1.2. Functional group polymerization (condensation or step-reaction polymerization)	10
1.3. Polymerization by ring-opening	16
2. Polymerization by addition mechanisms	17
2.1. Free radical addition polymerization	17
2.2. Addition polymerization by cationic mechanisms	52
2.3. Addition polymerization by anionic mechanisms	61
2.4. Addition polymerization by coordinated catalysts	75
2.5. Some special types of addition polymerization	80
3. Polymerization by condensation and ring-opening mechanisms	84
3.1. Basic features of linear polycondensation	85
3.2. Polycondensation of polyfunctional monomers	90
3.3. Practical methods for polycondensation	99
3.4. Some typical condensation polymers	104
4. Some special methods for polymer preparation	115
4.1. Chemical treatment of preformed polymers	115
4.2. Diels-Alder polymerization	116
References	117
 Chapter 2	
N. C. Billingham and A. D. Jenkins, The chemical structure of polymers	121
1. Introduction	122
2. Molecular weights and distributions	122
2.1. Basic definitions	122
2.2. Relation of molecular weight distribution to reaction mechanism	126
2.3. Practical methods for molecular weight measurement	134
2.4. Methods for measurement of molecular weight distributions	153
3. The microstructure of polymer chains	156
3.1. Structural isomerism	157
3.2. Sequence isomerism	165
3.3. Stereoisomerism	166
3.4. Isomerism in diene polymers	173
4. The bulk structure of polymers	175
4.1. The structure of crystalline polymers	179
4.2. The glass transition and structure of amorphous polymers	186
References	189

Chapter 3

J. A. Brydson, The glass transition, melting point and structure	193
1. Introduction	194
2. Theories of the glass transition	197
3. Effect of structure on T_g	203
3.1. Chain stiffness	204
3.2. Chain interaction factors	208
3.3. Geometrical factors including molecular symmetry	208
3.4. Effect of copolymerization on T_g	210
3.5. Effect of molecular weight on T_g	215
3.6. The effect of cross-linking, branching and cyclization on T_g	218
3.7. The effect of monomer, solvents and plasticizers on T_g	219
4. T_g in crystalline polymers	221
5. Multiple transitions in polymers	222
5.1. Identification of transitions	226
6. Experimental study of transitions	227
6.1. Apparent activation on energies associated with T_g	234
7. Numerical data	235
8. Transitions in some selected crystalline polymers	236
8.1. Polyethylene	236
8.2. Polypropylene	238
8.3. Polyoxymethylene (polyacetal)	239
8.4. Polytetrafluoroethylene (PTFE)	240
9. Relationship between T_g and T_m	240
10. Technical significance of transition temperatures	245
References	247

Chapter 4

A. Sharples, Crystallinity	251
1. Introduction	252
1.1. The nature of crystallinity in polymers	252
1.2. The types of polymers which crystallize	254
1.3. The importance of the amorphous regions	256
1.4. The temperature cycle for crystallizable polymers	258
1.5. The effect of crystallization in polymers	259
2. Structural units	261
2.1. Amorphous regions	261
2.2. Spherulites	263
2.3. The single crystal	267
2.4. The lamellar fibril	269
2.5. Intercrystalline fibrils	269
2.6. Microfibrils	270
2.7. Extended-chain lamellae	274
2.8. Crystallites	274
2.9. The development of spherulite structure	275

3. Experimental methods	277
3.1. Microscopy	277
3.2. Electron microscopy	279
3.3. X-ray diffraction	280
3.4. Density measurements	282
3.5. Differential thermal analysis	283
3.6. Other methods	283
4. Crystal nucleation and growth	284
4.1. Introduction	284
4.2. Nucleation	285
4.3. Growth	287
5. Overall crystallization	292
5.1. Introduction	292
5.2. Bulk crystallization kinetics	293
5.3. Secondary crystallization	297
6. Melting	297
6.1. General features	297
6.2. Practical determination of melting point	298
6.3. Partial melting, annealing and seeded crystallization	299
7. Factors determining crystallinity	303
7.1. Chemical composition	303
7.2. Temperature	305
7.3. Pressure	307
7.4. Orientation	307
7.5. Molecular weight	309
7.6. Solvents	311
8. The relation between properties and crystalline structure	313
8.1. Density	314
8.2. Optical properties	314
8.3. Mechanical properties	316
8.4. Permeability	317
8.5. Chemical reactivity	319
References	320

Chapter 5

K. J. Smith, Jr., Theories of chain coiling, elasticity, and viscoelasticity	323
1. Chain coiling	324
1.1. Statistics of polymer chains	327
1.2. Evaluation of the chain moments	332
1.3. The barrier to internal rotation	341
1.4. Inverse Langevin chain	345
2. Rubber elasticity	346
2.1. Statistics of polymer chain networks	348
2.2. Thermodynamics	357
2.3. Comparison of the Gaussian and non-Gaussian results	363
2.4. Modulus	365
2.5. Phenomenological theory of elasticity	366

3. Special situations	372
3.1. Swollen networks	372
3.2. Composite networks	380
3.3. Oriented networks	385
3.4. Crystallization of networks	387
4. Experimental behaviour of elastomers	396
5. Visco-elasticity	402
5.1. Phenomenological visco-elasticity	404
5.2. Boltzmann superposition principle	417
5.3. Molecular theory of visco-elasticity	422
References	439

Chapter 6

J. R. A. Pearson, Visco-elastic properties of molten polymers	443
1. What is visco-elasticity?	444
2. Observed visco-elastic phenomena	448
2.1. Uniform simple shear	448
2.2. Oscillatory simple shear	455
2.3. Rod climbing	457
2.4. Die swell	459
2.5. Convergent flow	462
2.6. Unstable flow	466
3. Mathematical models	467
3.1. Linear visco-elastic models	468
3.2. Non-linear extensions of linear models	472
3.3. General non-linear models. The simple fluid	473
3.4. Models based on structure	475
3.5. Models relevant for restricted flow fields. Approximations	477
4. Comparison with experiment	479
4.1. Simple shear. Flow curves	480
4.2. Oscillatory simple shear. Dynamic measurements	483
4.3. Uniform extension. Elongational viscosity	484
4.4. Recovery from simple shear or uniform extension	484
4.5. Variation with temperature	485
4.6. General conclusions	486
References	486

Chapter 7

N. J. Mills, Optical properties	489
1. Introduction	490
2. Isotropic polymers	491
2.1. The transmission of light in polymers	491
2.2. Additivity of bond polarizabilities	492
2.3. Light scattering from inhomogeneous polymers	497

3. Anisotropic amorphous polymers	500
3.1. Birefringence of rubbers	500
3.2. Flow birefringence	512
3.3. The birefringence of glassy polymers and photo-elastic analysis	516
3.4. The depolarization of scattered light	520
3.5. The Kerr effect	521
4. Anisotropic crystalline polymers	522
4.1. The optical anisotropy of polymer crystals	522
4.2. The birefringence of partially crystalline polymers	523
4.3. Light scattering from partially crystalline polymers	525
4.4. Time-dependent orientation processes in crystalline polymers	530
5. Dichroism	531
6. Optical applications of polymers	533
References	534

Chapter 8

Joseph J. Bernardo and Harry Burrell, Plasticization 537

1. Introduction	538
2. Plasticizer definitions and functions	538
2.1. Primary and secondary plasticizers	539
2.2. Simple and polymeric plasticizers	542
2.3. Convertible, inert and internal plasticizers	543
2.4. Antiplasticizers	545
3. Mechanism of plasticization	546
3.1. Solubility parameter theory	548
3.2. Mechanistic theory	554
4. Physical and chemical properties related to plasticized systems	555
4.1. Compatibility	555
4.2. Efficiency	558
4.3. Permanence	560
5. Mechanical properties related to plasticized systems	565
5.1. Creep	566
5.2. Stress relaxation	566
5.3. Stress-strain	566
5.4. Glass-transition temperature	571
5.5. Hardness	575
6. Compounding components and methods	575
6.1. Components	575
6.2. Methods of compounding	576
6.3. Hot compounding	576
6.4. Dry blending	577
6.5. Plastisol dispersion	577
6.6. Solution process	578
References	578

Chapter 9

E. H. Andrews, Fracture	579
1. Introduction	580
2. Macroscopical fracture theory	581
2.1. Theoretical and actual strengths	581
2.2. Stresses at a crack	582
2.3. Energy balance criterion	584
2.4. Evaluation of $-\partial\mathcal{E}/\partial A$	586
2.5. The significance of W for inelastic materials	588
2.6. Applications of the fracture criterion	589
2.7. Conclusion	598
3. Molecular fracture	599
3.1. The kinetic concept of fracture	599
3.2. Reconciliation with macroscopic theory	602
3.3. Direct evidence of molecular fracture	603
4. Fracture and microstructure	608
4.1. The general problem	608
4.2. Crystalline/amorphous microstructures	609
4.3. Deformation and fracture of single lamellar crystals	613
4.4. Fracture and microstructure in bulk polymers	614
4.5. Fracture in spherulitic structures	618
4.6. Conclusion	619
References	619

Chapter 10

C. Bucknall, K. V. Gotham and P. I. Vincent, Fracture II—the empirical approach	621
1. Introduction	622
2. Tensile testing	623
2.1. Low speed tensile tests	623
2.2. High speed tensile testing	627
2.3. Tensile impact testing	628
2.4. Factors affecting tensile behaviour	628
3. Fatigue testing	639
3.1. Introduction	639
3.2. Fatigue variables	640
3.3. Failure	642
3.4. Static fatigue	643
3.5. Dynamic fatigue	653
4. Impact testing	664
4.1. Notches	665
4.2. Specific tests	669
4.3. Impact behaviour of particular polymers	675
5. Concluding remarks	682
References	684

Chapter 11

Roger P. Kambour and Richard E. Robertson, The mechanical properties of plastics

1. Mechanical tests	687
1.1. Flexure	688
1.2. Tensile test	690
1.3. Impact strength	691
1.4. Hardness test	692
1.5. Fatigue test	692
2. The structure of plastics	693
2.1. The crystalline morphology	694
2.2. The glassy morphology	698
3. Molecular motions and mechanical relaxations	701
3.1. General sources of the temperature dependence of modulus	702
3.2. Phenomenology and methods of measurement of secondary relaxations	705
3.3. Relaxation behavior of poly(methylmethacrylate) (PMMA)	711
3.4. Polycarbonate	715
3.5. Polyethylene	720
3.6. Block and graft copolymers	743
3.7. Summary of types of relaxations	745
4. Modulus	750
4.1. The mathematics of elasticity	750
4.2. Elastic constants for polyethylene	753
4.3. Crystal moduli	756
4.4. Measured moduli of crystalline and glassy plastics	756
5. Creep	758
5.1. The three stages of deformation under stress	760
5.2. Dependence of creep on time and temperature	761
5.3. Dependence of creep on stress	768
5.4. Mechanism of the flow in creep	772
6. Behavior at high stresses	775
7. Yielding and flow	781
7.1. Yielding and flow of glassy plastics: stress-induced fluidization	786
7.2. Yielding and flow of crystalline plastics	793
8. Crazing in glassy polymers	801
8.1. Craze structure	801
8.2. Kinetics of craze initiation and growth	806
8.3. The role of crazing in fracture	810
8.4. Solvent crazing	814
References	817

Chapter 12

J. W. S. Hearle and E. A. Vaughn, Mechanical properties of fibres and fibre assemblies

1. The structure of fibres	823
1.1. Introduction	824

1.2. Fibre types	824
1.3. Levels of structure in fibres	825
1.4. Diverse views of structure	825
1.5. A unified view of fibre structure	830
1.6. Cellulosic fibres	832
1.7. Protein fibres	836
1.8. Polyamide fibres	838
1.9. Other synthetic fibres	840
1.10. Moisture absorption in fibres	841
2. Mechanical properties	842
2.1. Anisotropy	842
2.2. Axial stress-strain behaviour	845
2.3. Recovery	861
2.4. Stress-time and strain-time behaviour	864
2.5. Axial dynamic properties	869
2.6. Other stress-strain relationships	873
3. Theories of deformation in fibres	875
3.1. Various types of theoretical approaches	875
3.2. Modes of deformation	876
3.3. Time-dependence	878
3.4. The behaviour of ordinary rayon	881
3.5. Natural plant fibres	888
3.6. Wool and hair fibres	891
3.7. Polyamide fibres	905
3.8. Other synthetic fibres	906
4. Fatigue in textile materials	907
4.1. Fatigue testing	907
4.2. Experimental aspects	908
4.3. Theoretical aspects	911
4.4. Statistical aspects	914
4.5. Fracture surface morphology	916
5. Fibre assemblies	922
5.1. General	922
5.2. Fibre assembly processes	922
5.3. Bonded fibre fabrics	924
References	929

CONTENTS OF VOLUME 2

Chapter 13

D. M. Brewis, Adhesion	933
1. General introduction	934
2. Factors affecting adhesion	934
2.1. Introduction	934
2.2. Viscosity	936
2.3. Surface energy	936
2.4. Weak boundary layers	938
2.5. Surface pre-treatments	940
2.6. Stress concentrations	940
2.7. Conditions of joint formation and testing	941
2.8. Conclusions	942
3. Theories of adhesion	944
3.1. Mechanical theory	944
3.2. Adsorption theory	944
3.3. Diffusion theory	944
3.4. Electrostatic theory	945
3.5. Conclusions	946
4. Forces operating at the interface	946
5. Interfacial and cohesive failure	947
6. Individual polymers	948
6.1. Introduction	948
6.2. Polyolefins	948
6.3. Fluorinated polymers	951
6.4. Poly(ethylene terephthalate)	952
6.5. Poly(vinylchloride)	954
6.6. Poly(hexamethylene adipamide)	955
6.7. Elastomers	955
6.8. Acrylonitrile-butadiene-styrene terpolymers	955
6.9. Poly(phenylene oxide)	956
7. Conclusions	956
References	957

Chapter 14

J. K. Lancaster, Friction and wear	959
1. Introduction	960
2. Friction	960
2.1. Elastic deformation—single contacts	963
2.2. Multiple contacts	965
2.3. Rolling friction	967
2.4. Sliding friction of rubbers	972
2.5. Sliding friction of rigid polymers	976
2.6. Lubrication by fluids	985

3. Wear	988
3.1. Classification of wear	989
3.2. Wear testing	990
3.3. Abrasive wear	993
3.4. Erosive wear	1005
3.5. Fatigue	1009
3.6. Adhesive wear	1016
3.7. Composites	1025
3.8. Design considerations	1036
4. Areas of uncertainty	1040
References	1042

Chapter 15

R. Koningsveld, Polymer solutions and fractionation	1047
1. Introduction	1048
2. Free enthalpy functions and related equations	1050
2.1. Free enthalpy of mixing	1050
2.2. Consolute state and spinodal	1055
2.3. Equilibrium conditions and the fractionation equation	1056
3. Phase diagrams	1058
3.1. General considerations	1058
3.2. Cloud-point curves	1065
3.3. Coexistence curves	1076
3.4. Separation into three liquid phases	1082
3.5. The influence of pressure	1087
4. The free enthalpy function	1088
4.1. Determination of the g function	1088
4.2. The Shultz-Flory method (determination of the θ temperature)	1094
5. Polymer fractionation	1097
5.1. Preparative fractionation	1097
5.2. Analytical fractionation	1114
5.3. Alternative analytical approach	1124
6. Conclusions	1127
7. Appendices	1128
7.1. Molecular weight distributions and average molecular weights	1128
7.2. Criteria of fractionation efficiency	1131
References	1132

Chapter 16

M. M. Breuer, Polyelectrolytes	1135
1. Introduction	1136
2. Preparation of polyelectrolytes	1136
3. Solubility of polyelectrolytes	1137
4. The thermodynamics of polyelectrolyte solutions	1137
5. The electrostatic free energy of polyelectrolytes	1139

6.	Molecular models for polyelectrolyte molecules in solution	1141
6.1.	The rigid, impenetrable spherical molecule	1141
6.2.	The rigid, rod-like molecule	1144
6.3.	The electrostatic free energy of flexible-chain molecules	1145
7.	The potentiometric titration of polyelectrolytes	1148
7.1.	The titration equation	1148
7.2.	Treatment of experimental titration data	1149
8.		1153
8.1.	Irreversible processes in polyelectrolyte solutions	1153
8.2.	The molecular expansion of flexible polyelectrolytes	1155
9.	Electrophoresis	1159
10.	Electrolytic conductance	1162
11.	The sedimentation rate	1163
12.	Diffusion	1166
13.	The effect of polyelectrolytes on small ions	1169
13.1.	Ion binding	1170
14.	Catalytic and inhibitory effect of polyelectrolytes	1172
14.1.	Reaction with the poly-ions	1174
14.2.	Reactions between two small molecular weight ionic species	1174
14.3.	Kinetic effect of polyelectrolyte molecules containing catalytic substituents	1176
15.	Some dielectric properties of polyelectrolyte solutions	1177
16.	Cross-linked polyelectrolyte networks and ion exchangers	1180
16.1.	Bulk properties of polyelectrolytes	1183
	References	1184

Chapter 17

Donald A. Seanor,	Electrical properties of polymers	1187
1.	Introduction	1188
1.1.	Parameters involved	1190
1.2.	Experimental techniques	1191
2.	The charge carriers	1193
2.1.	Intrinsic generation	1193
2.2.	Impurity conduction	1196
2.3.	Injection processes	1197
2.4.	Photoconductivity	1203
2.5.	Space-charge-limited currents	1208
2.6.	Thermally stimulated currents	1214
3.	Charge-carrier mobility	1217
4.	Ionic conduction	1226
5.	Conductivity of polymers	1233
5.1.	Types of polymer	1233
5.2.	Morphology and similar effects	1234
5.3.	Polymethylenes	1238
5.4.	Polymers containing conjugated double bonds	1239
5.5.	Charge-transfer complexes	1245
5.6.	Polymeric salts of the tetracyanoquinodimethane radical anion	1257
5.7.	Polymers containing metal atoms	1263

6. Contact electrification	1266
7. Electrets	1271
8. Dielectric breakdown	1272
References	1275

Chapter 18

G. L. Link, Dielectric properties of polymers, I	1281
1. Introduction	1282
2. General relations	1283
3. Nonpolar polymers	1285
4. Polar polymers	1289

Chapter 19

T. G. Parker, Dielectric properties of polymers, II	1297
1. Basic theory of dielectric behaviour of small molecules	1298
1.1. Introduction	1298
1.2. Permittivity in a static field	1300
1.3. Permittivity in an alternating field	1300
2. Complexity arising from chain structure of polymers	1302
2.1. Dipole moment of an isolated polymer molecule	1302
2.2. Dipole moment of non-isolated polymer chains	1308
2.3. Polymer chains in an alternating field	1309
3. A.C. effects arising from the mobility of charge carriers	1311
3.1. Effects arising from bulk conduction	1311
3.2. Interfacial polarization	1312
4. Molecular theories of relaxation in polymers	1313
4.1. Amorphous polymers	1313
4.2. Crystalline polymers	1313
4.3. Steric hindrance and plasticization	1314
4.4. Stereospecificity	1314
5. Dielectric relaxation in polymer solutions	1315
6. Dielectric behaviour of specific polymers	1317
6.1. Non-polar polymers	1317
6.2. Polar polymers	1320
References	1326

Chapter 20

G. W. Chantry and John Chamberlain, Far infrared spectra of polymers	1329
1. General introduction	1330
2. Theory of the absorption and dispersion of electromagnetic waves in condensed media	1330
3. Absorption spectroscopy in the far infrared	1337
4. Far infrared refractometry	1350
4.1. Basic theory	1350
4.2. Measurements of real refractive index	1353
4.3. Experimental determination of n using the 337 μm HCN laser	1354

4.4. Complex refractive index measurements with broad-band radiation. Fourier refractometry	1358
4.5. Experimental apparatus for broad-band Fourier refractometry of polymers	1362
4.6. The uses of the refraction spectrum	1365
5. Experimental results	1367
5.1. Introduction	1367
5.2. Polyethylene	1369
5.3. Polypropylene	1372
5.4. TPX	1374
5.5. Polytetrafluorethylene	1375
5.6. Polymethylmethacrylate and polystyrene	1378
5.7. Miscellaneous polymers	1379
References	1380

Chapter 21

A. Pidcock, Nuclear magnetic resonance	1383
1. Introduction	1384
2. Principles of high-resolution NMR	1384
2.1. Properties of nuclei	1384
2.2. The NMR experiment	1386
2.3. Nuclei in molecules	1388
2.4. Chemical shifts	1390
2.5. Coupling constants	1395
2.6. Quadrupole effects	1399
2.7. Summary	1400
2.8. Solvents	1401
2.9. Signal-to-noise ratio	1402
2.10. Double resonance	1402
2.11. Deuteration	1403
3. High-resolution NMR spectra of polymers	1403
3.1. Poly(methylmethacrylate)	1403
3.2. Poly(vinylchloride)	1411
3.3. Polyethylene	1420
3.4. Polyisoprene	1421
3.5. Vinylidene chloride-isobutylene copolymer	1422
4. Broad-line NMR spectra	1424
4.1. Line shapes in a rigid lattice	1425
4.2. Motional narrowing	1428
4.3. Degree of crystallinity	1430
4.4. Second moments of NMR lines	1431
4.5. Studies of relaxation times	1434
4.6. Polyisobutylene	1436
4.7. Poly(methylmethacrylate)	1437
4.8. Polyethylene	1440
4.9. Other studies	1440
References	1440

Chapter 22

Norman Grassie, Degradation	1443
1. Introduction	1444
2. Thermal degradation	1446
2.1. Introduction	1446
2.2. Depolymerization	1447
2.3. Substituent reactions	1486
3. Mechanical degradation	1504
4. Photodegradation	1513
4.1. Introduction	1513
4.2. Acrylic and methacrylic ester polymers	1515
4.3. Poly(α -methylstyrene)	1519
4.4. Poly(methyl isopropenyl ketone) and poly(methyl vinyl ketone)	1519
4.5. Polystyrene	1520
4.5. Polyacrylonitrile	1523
5. Oxidation	1524
5.1. Introduction	1524
5.2. Unsaturated polymers	1528
5.3. Saturated polymers	1533
References	1538

Chapter 23

A. Charlesby, Radiation effects in polymers	1543
1. Introduction	1544
2. Radiation doses	1545
3. Radiation sources	1547
4. Basic processes	1547
5. Main chain scission—degradation	1548
6. Cross-linking and network formation	1550
7. Memory effect	1554
8. Reinforcement	1555
9. Electrical effects	1557
10. Graft copolymers	1557
11. Effect of O ₂	1558
12. Some practical applications	1558
13. Polyester cure	1559

Chapter 24

P. Arnold and H. Willis, Identification and analysis of plastic materials	1561
1. Introduction	1562
1.1. Components of a plastic composition	1563
1.2. Plasticizers, stabilizers, anti-oxidants, slip agents, surface-active agents and antistatic additives	1565
1.3. Special tests on plastics compositions	1566
2. Qualitative elemental analysis	1566
2.1. Preparation of the test solution	1567
2.2. Nitrogen	1567

2.3. Sulphur	1567
2.4. Phosphorus	1568
2.5. Fluorine	1568
2.6. Halogens (chlorine, bromine or iodine)	1569
2.7. Fluorescein test (bromine and iodine only)	1569
2.8. Starch test (iodine only)	1570
3. Simple identification tests for plastics	1570
3.1. Surface character of the specimen	1571
3.2. Flotation in water	1572
3.3. Transparent samples	1572
3.4. Translucent samples	1573
3.5. Heating and burning tests	1573
3.6. Solubility tests	1576
3.7. Qualitative tests for elements	1576
3.8. Colour tests	1577
3.9. Tests with the microscope	1577
3.10. General observations	1577
4. Methods of separating compositions	1578
4.1. Solvent extraction	1578
4.2. Solution and precipitation	1581
4.3. Coagulation of latices	1582
4.4. Vacuum distillation	1583
4.5. Pyrolysis in nitrogen	1583
4.6. Chromatography	1584
5. Identification of polymers and monomers	1585
5.1. Identification of polymeric constituents by IR spectroscopy	1585
5.2. Identification of polymers by high-resolution NMR spectroscopy	1596
5.3. Identification of polymers by pyrolysis/gas-liquid chromatography	1602
5.4. ATR (attenuated total reflection) IR spectroscopy in the examination of polymers	1605
5.5. Identification of polymers by chemical methods	1608
5.6. Identification of monomeric constituents by IR spectroscopy	1611
5.7. Identification of monomeric organic substances by NMR spectroscopy	1613
5.8. Identification of additives to polymer compositions by UV spectroscopy	1614
5.9. The identification of additives to polymers by mass spectroscopy	1615
5.10. Identification of constituents from polymer compositions by gas chromatography	1617
5.11. Identification of gas-chromatographic fractions by IR analysis	1618
5.12. Gas chromatography/mass spectrometry	1622
5.13. Preliminary examination of inorganic materials	1623
5.14. Identification of inorganic constituents by IR spectroscopy	1623
5.15. Identification of inorganic constituents from polymer compositions by X-ray diffraction	1625
6. Quantitative analytical methods	1626
6.1. Elemental organic analysis	1626
6.2. Elemental inorganic analysis	1629
6.3. Quantitative spectroscopic methods of analysis in the polymer field	1631
6.4. Applications of non-aqueous titrimetry to polymer analyses	1635

6.5. Quantitative applications of gas chromatography	1636
6.6. Elemental analysis by X-ray fluorescence spectrometry	1637
6.7. Determination of residual monomers in polymer compositions	1639
6.8. Moisture content of polymer compositions	1640
References	1641

Chapter 25

William E. Gibbs and Thaddeus E. Helminiak, Polymers for use at high and low temperatures

1. Introduction	1645
2. Polymers for use at high temperatures	1648
2.1. The chemical stability of polymers at high temperatures	1649
2.2. Physical properties of high-temperature polymers	1658
2.3. High-temperature, high T_g polymers	1661
2.4. High-temperature, low T_g polymers	1691
2.5. Summary	1696
3. Polymers for use at low temperatures	1705
3.1. Physical properties of low-temperature polymers	1706
3.2. Low-temperature polymers	1712
References	1713

Chapter 26

L. N. Phillips, Composites

1. Scope	1718
2. Early history	1719
3. Techniques in fabrication	1722
3.1. Glass-fibre techniques	1722
3.2. Vacuum-bag moulding	1723
3.3. Spray-up technique	1723
3.4. Filament-winding	1724
3.5. Compression moulding	1725
3.6. Phenolic/asbestos techniques	1726
3.7. Carbon fibre-reinforced plastics	1730
4. Design considerations	1731
4.1. Mechanism	1732
4.2. Relative properties of fibre and matrix	1733
4.3. Volume fractions	1734
4.4. Orientation	1735
5. Uses	1736
References	1742

Chapter 27

J. W. White, Neutron spectroscopy of polymers

1. Introduction	1744
2. General theory of neutron scattering	1745
2.1. The effect of atomic motions	1747

3. Incoherent scattering spectroscopy and molecular forces in polymers	1751
3.1. Time-of-flight spectroscopy for incoherent scattering spectroscopy	1752
3.2. Methyl torsions and other side-group motions—isotopic substitution method	1755
3.3. Practical applications	1758
3.4. Vibrational modes of the polymer chain—density of states spectra	1760
4. Coherent neutron scattering spectroscopy—determination of dispersion curves	1766
4.1. Experimental methods	1766
4.2. Dispersion curves and force fields	1769
4.3. Dispersion curves in long-chain polymers	1776
4.4. Conclusions on polymer forces	1784
5. General conclusions	1786
References	1786
Subject index	1789
Author index	1799
