|           |                                                       |    |    |    |    |
|-----------|-------------------------------------------------------|----|----|----|----|
| CHAPTER 1 | A MASTER EQUATION AND TWO PARTITION FUNCTIONS         |    |    |    |    |
| 1.1       | The Scope of Statistical Mechanics                    | .. | .. | .. | 1  |
| 1.2       | A Master Equation                                     | .. | .. | .. | 3  |
| 1.3       | The Average of a Mechanical Property                  | .. | .. | .. | 6  |
| 1.4       | The Grand Canonical and Canonical Partition Functions |    |    |    | 9  |
| 1.5       | Perfect Gases                                         | .. | .. | .. | 13 |
| 1.6       | The Occupancy of a Molecular Quantum State            |    |    | .. | 18 |
| 1.7       | $PV$ -Energy Relationship for Monatomic Perfect Gases |    |    |    | 20 |
| CHAPTER 2 | GENERAL CHARACTERISTICS OF THE PARTITION FUNCTION     |    |    |    |    |
| 2.1       | Separability of the Hamiltonian                       | .. | .. | .. | 23 |
| 2.2       | Bose-Einstein, Fermi-Dirac and Boltzmann Systems      | .. |    |    | 25 |
| 2.3       | The Classical Limit                                   | .. | .. | .. | 30 |
| 2.4       | Heat Capacity and Equipartition                       | .. | .. | .. | 32 |
| 2.5       | Symmetry Number                                       | .. | .. | .. | 36 |
| 2.6       | Isotopes                                              | .. | .. | .. | 40 |
| 2.7       | Nuclear Spin                                          | .. | .. | .. | 42 |
| 2.8       | Coordinate Transformations                            | .. | .. | .. | 42 |
| CHAPTER 3 | PERFECT GASES AND THE INTERNAL PARTITION FUNCTION     |    |    |    |    |
| 3.1       | Monatomic Molecules                                   | .. | .. | .. | 45 |
| 3.2       | Diatomic Molecules                                    | .. | .. | .. | 46 |
| 3.3       | The Oscillator Partition Function                     | .. | .. | .. | 48 |
| 3.4       | The Linear Rotator Function                           | .. | .. | .. | 50 |
| 3.5       | Molecular Hydrogen                                    | .. | .. | .. | 52 |
| 3.6       | Polyatomic Molecules                                  | .. | .. | .. | 55 |
| 3.7       | Polyatomic Rotator Function                           | .. | .. | .. | 57 |
| 3.8       | Polyatomic Normal Coordinates                         | .. | .. | .. | 60 |
| 3.9       | Polyatomic Molecule Symmetries                        | .. | .. | .. | 61 |
| 3.10      | Perfect Gas Thermodynamic Functions                   | .. | .. | .. | 64 |
| CHAPTER 4 | IMPERFECT GASES                                       |    |    |    |    |
| 4.1       | Introduction                                          | .. | .. | .. | 70 |
| 4.2       | Simple Cluster Functions                              | .. | .. | .. | 71 |
| 4.3       | The Virial Expansion                                  | .. | .. | .. | 74 |
| 4.4       | Proof of the Virial Development                       | .. | .. | .. | 75 |
| 4.5       | Interpretation of $P/kT = \Sigma b_n z^n$             | .. | .. | .. | 81 |
| 4.6       | Evaluation of the Virial Coefficients                 | .. | .. | .. | 82 |
| 4.7       | Condensation                                          | .. | .. | .. | 85 |
| 4.8       | Plasma and the Debye Limit                            | .. | .. | .. | 88 |

|           |                                                                                           |     |
|-----------|-------------------------------------------------------------------------------------------|-----|
| CHAPTER 5 | SOLIDS                                                                                    |     |
| 5.1       | Overall Survey and Electronic Excitation                                                  | 96  |
| 5.2       | Crystal Lattice Hamiltonian                                                               | 99  |
| 5.3       | Lattice Vibration Spectra                                                                 | 103 |
| 5.4       | The Debye Lattice Theory                                                                  | 105 |
| 5.5       | Debye Thermodynamic Functions                                                             | 108 |
| 5.6       | Thermal Expansion                                                                         | 109 |
| 5.7       | Crystal Imperfections and Order-Disorder                                                  | 111 |
| CHAPTER 6 | DENSE FLUIDS                                                                              |     |
| 6.1       | Notation and the Potential Energy                                                         | 115 |
| 6.2       | Distribution Functions                                                                    | 119 |
| 6.3       | Equations for the Distribution Functions                                                  | 122 |
| 6.4       | The Potentials of Average Force                                                           | 124 |
| 6.5       | The Kirkwood Superposition Assumption                                                     | 125 |
| 6.6       | The Virial of Clausius                                                                    | 127 |
| 6.7       | Calculation of $F_n(\mathbf{z}, T, [\mathbf{n}])$ from $F_n(\mathbf{y}, T, [\mathbf{n}])$ | 129 |
| 6.8       | The Osmotic Pressure                                                                      | 131 |
| 6.9       | The Cluster Development for Osmotic Pressure                                              | 133 |
| 6.10      | Moments and Thermodynamic Quantities                                                      | 137 |
| 6.11      | Open and Closed System Moments                                                            | 144 |
| 6.12      | Integral Equations                                                                        | 146 |
| 6.13      | Monte Carlo                                                                               | 150 |
| CHAPTER 7 | QUANTUM STATISTICS                                                                        |     |
| 7.1       | Introduction                                                                              | 152 |
| 7.2       | Bose-Einstein Perfect Gases                                                               | 154 |
| 7.3       | Black Body Radiation                                                                      | 162 |
| 7.4       | Fermi-Dirac Perfect Gases                                                                 | 168 |
| 7.5       | Density Matrix Formulation                                                                | 176 |
| 7.6       | The Momentum Representation                                                               | 183 |
| 7.7       | Matrix Transformations                                                                    | 186 |
| 7.8       | The Wigner Representation                                                                 | 189 |
| 7.9       | The Equilibrium Density Matrix                                                            | 192 |
| 7.10      | The Classical Limit                                                                       | 200 |
| 7.11      | Perfect Bose Gas Cluster Function                                                         | 204 |
| CHAPTER 8 | DERIVATION OF THE PARTITION FUNCTION EQUATIONS                                            |     |
| 8.1       | Outline of the Derivation                                                                 | 207 |
| 8.2       | The Ensemble Concept                                                                      | 208 |
| 8.3       | The Microcanonical Ensemble, the Liouville Theorem                                        | 210 |
| 8.4       | The Ergodic Hypothesis                                                                    | 212 |
| 8.5       | The Quantity $S = k \ln \Omega$                                                           | 217 |
| 8.6       | The Quantities $T$ and $P$                                                                | 222 |
| 8.7       | The Thermodynamic Laws                                                                    | 224 |
| 8.8       | The Canonical Ensembles                                                                   | 225 |
| 8.9       | Methodology of the Partition Functions                                                    | 230 |
| 8.10      | The General Entropy Expression, and the Increase of Entropy                               | 232 |
| 8.11      | On Logic and Mathematical Rigor                                                           | 236 |
| INDEX     |                                                                                           | 239 |
