

Contents

Series Preface	vii
Chapter 1 Introduction	1
1 The partition coefficient	1
2 Effect of concentration	2
3 Hydrophobic or hydrophilic?	3
4 The significance of the octanol–water pair	4
5 Symbols and nomenclature	4
6 Properties of 1-octanol and water	4
7 The structure of ‘wet’ octanol and implications	5
8 Usefulness of the octanol–water partition coefficient	12
References	15
 Chapter 2 Thermodynamics and Extrathermodynamics of Partitioning	19
1 Review of chemical thermodynamic principles	19
2 Excess properties of the octanol–water system	26
3 Log K_{ow} and solubility	27
4 Transfer of solute among pure, gaseous and solution phases	31
5 Variation of K_{ow} with temperature	33
6 Implication of mutually saturated solvents	36
7 Log K_{ow} and other physicochemical properties	49
8 Partition coefficients of isomers and tautomers	50
References	52
 Chapter 3 Experimental Methods of Measurement	57
1 Direct methods	57
2 Indirect methods	64
References	74

Chapter 4	Discussion of Measurement Methods	79
1	Water solubility correlation.	79
2	High performance liquid chromatography (RP-HPLC) correlations	87
3	Thin-layer chromatography (TLC) correlations	100
4	Measured activity coefficients.	100
5	Centrifugal partition chromatography	104
6	Other methods.	104
7	K_{ow} measurement of very hydrophobic compounds	104
8	General remarks.	106
	References	108
Chapter 5	Methods of Calculating Partition Coefficients.	113
1	Fragment or group contribution methods	113
2	Atomistic methods	117
3	'Whole molecule' approaches.	118
4	Other methods.	121
5	Linear solvation energy relationships (LSER)	123
	References	124
Chapter 6	Discussion on Log K_{ow} Predictive Methods	129
1	Fragment methods	129
2	Whole molecule methods	142
3	Fragments or molecular properties?	154
	References	154
Appendix		157
Index		169
