<i>Foreword</i>	v
<i>Preface</i>	vii
<i>Symbols and Abbreviations</i>	xiii

1.	Presentation of the Book	1
	I. How the Authors Became Involved in Micellar Liquid Chromatography	
	II. The Technique	
	III. The Book	
	References	
2.	Physicochemical Properties of Micellar Media	9
	I. Introduction	
	II. Surfactant Molecules	
	III. Surfactant Solutions	
	IV. Solubilization in Micellar Phases and Microemulsions	
	V. Conclusions	
	References	
3.	Historical Development of Micellar Liquid Chromatography	57
	I. Ion Pair Chromatography	
	II. The Birth of Micellar Liquid Chromatography	
	III. Modern Micellar Liquid Chromatography	
	References	

4.	The Role of the Stationary Phase	79
	I. Introduction	
	II. Stationary Phase Characterization	
	III. Surfactant Adsorption	
	IV. Stationary Phases and Selectivity	
	V. Equilibration and Care of the Column	
	References	
5.	Partitioning Behavior in Micellar RPLC Systems	115
	I. Introduction	
	II. The Three-phase Model	
	III. Hybrid Micellar Mobile Phases	
	IV. Evaluation of Partition Coefficients	
	V. The Solubility Limit Theory	
	VI. Effect of pH on Retention	
	VII. Effect of Ionic Strength on Retention	
	VIII. Thermodynamic Properties Based on the Three-phase Model	
	References	
6.	The Efficiency Problem	173
	I. Introduction	
	II. Chromatographic Process and Efficiency	
	III. Chromatographic Process and Micellar Phases	
	IV. Remediation of Reduced Efficiency	
	V. Conclusion	
	References	
7.	Elution Strength and Selectivity with Micellar Systems	203
	I. Introduction	
	II. Elution Order Reversals	
	III. The Choice of Surfactant as a Means to Control Selectivity	
	IV. Solubility Limit Theory and Selectivity	
	V. Effect of Organic Modifiers on the Elution Strength and Selectivity	
	VI. Relationship Between Elution Strength and Selectivity	
	VII. Influence of Temperature on Selectivity	
	References	
8.	Modeling of Retention Behavior	241
	I. Introduction	
	II. Retention Behavior in Pure Micellar Eluents	
	III. Retention Behavior in Hybrid Micellar Eluents at Constant pH	
	IV. Physicochemical Meaning of the Empirical Models	
	V. Simultaneous Effect of pH, Micelle and Organic Modifier	
	VI. Neural Networks	
	VII. Factors Affecting the Prediction Capability of the Models	
	VIII. Optimization of the Resolution	
	IX. Easy Modeling and Optimization in MLC with the MICHROM Software	
	References	

9. Quantitation of Hydrophobicity	293
I. Introduction	
II. Retention Behavior of Homologous Series	
III. Quantitative Structure-retention Relationships	
IV. Quantitative Retention-activity Relationships	
References	
10. Analytical Use of Micellar Liquid Chromatography	343
I. Introduction	
II. Micellar Chromatography of Proteins and Enzyme Activity	
III. Control of Pharmaceutical Preparations	
IV. Miscellaneous Applications	
References	
11. Rapid Analysis of Untreated Physiological Fluids	387
I. Introduction	
II. The Direct Injection Approach	
III. Use of Micellar Mobile Phases	
IV. Background Signal of the Matrix Fluid	
V. Application Development	
VI. Screening of Illegal Drugs in Sport	
VII. Previous Separation of the Drugs	
References	
12. Enhanced Detection in Micellar Medium	429
I. Introduction	
II. Enhanced Fluorescence Detection	
III. Sensitized Terbium Fluorescence	
IV. Micelle-stabilized Room-temperature Phosphorescence	
V. Inductively-coupled Plasma-mass Spectrometry	
VI. Amperometric Detection	
References	
13. Expanding the Micellar Liquid Chromatography Field	463
I. Introduction	
II. Use of Original Mobile Phases	
III. Use of Original Stationary Phases	
IV. Micellar Phases and Ions	
V. Micellar Separations Without a Classic Column	
VI. Conclusion	
References	
Appendix I: MICHROM Software	501
Appendix II: Critical Micelle Concentrations of Selected Surfactants	503

Appendix III: Surfactant Association Coefficients	527
Appendix IV: How to Prepare a Ternary Phase Diagram	593
<i>Index</i>	597
