Foreword	5
Introduction	11
1. Physical Characterisation of Pigments	12
1.1 Particle morphology	12
1.2 Crystal structure	14
1.2.1 Crystal modifications. Polymorphism	14
1.2.2 Isomorphism and anisotropy	15
1.2.3 X-ray crystallography	16
1.3 Particle size research	19
1.3.1 Particle size distribution	19
a. Sieve analysis	20
b. Determination by electron microscopy	20
c. Analysis by sedimentation techniques	21
d. The Coulter counter	23
e. Methods of presenting results	23
1.3.2 Specific surface area	25
a. The Freundlich adsorption isotherm	25
b. Langmuir's adsorption theory	26
c. The adsorption isotherm according to Brunauer, Emmett and Teller	28
d. Determination of the average particle size	30
Problem 1	32
1.4 Surface character	33
1.4.1 Polarity and hydrophilicity	34
1.4.2 Surface tension and capillarity	35
a. Surface tension	35
b. Capillarity	42
1.4.3 Electrical polarisability	44
a. Polarisation of dielectrics in an electric field	44
b. Polarisability and refractive index	46
c. Polarisability and pigment/binder interaction	46
1.4.4 Surface treatment	47

2.	Optical Properties of Pigmented Systems	49
2.1	Reflection. Gloss and gloss haze	50
2.1.1	Gloss	50
2.1.2	Gloss haze	55
2.2	Light scattering by colloidal disperse particles	57
2.2.1	Rayleigh scattering	57
2.2.2	Mie theory	60
2.3	Absorption and scattering as factors in the tintorial properties of pigments	65
2.3.1	Hiding power, semi-transparency and transparency	66
2.3.2	Lightening power	74
2.3.3	Tinting strength and depth of shade	75
2.3.4	Hue (shade)	77
3.	The Rheological Behaviour of Pigment Dispersions	80
3.1	Introduction	80
3.2	Newton's law of viscosity	80
3.3	Dependence of viscosity on temperature	82
	Problem 2	84
3.4	Flow properties of concentrated suspensions and molecular colloids	86
3.4.1	Newtonian flow	86
3.4.2	Structural viscosity (pseudoplasticity)	87
	Problem 3	89
3.4.3	Dilatancy	90
3.4.4	Plasticity	91
	a. Bingham or linear-plastic flow	92
	b. Non-linear plasticity (Casson viscosity)	93
	Problem 4	96
	c. Plastic-dilatant flow	97
3.4.5	Shear-time dependent flow	97
	a. Thixotropy	98
	b. Rheopexy	100
3.4.6	Viscoelasticity	101
3.4.7	Flow behaviour of water-thinnable binder systems	104
3.5	Rheological behaviour of pigmented systems in practice	106
3.5.1	Basic aspects	106
3.5.2	Printing inks	108
3.5.3	Paints and enamels	111
3.5.4	Plastics	114
3.6	Closing remarks	115

4.	The Dispersion Process: Physico-chemical Fundamentals	117
4.1	Introduction	117
4.2	Stages of the dispersion process	118
4.2.1	Mechanical breakdown	118
4.2.1.1	Forces of interaction between the pigment particles	118
4.2.1.2	Types of mechanical breakdown	121
4.2.2	Wetting	123
4.2.2.1	Energetic approach	123
4.2.2.2	Wetting kinetics	126
4.2.3	Stabilisation	127
4.2.3.1	Fundamental aspects	127
4.2.3.2	Stabilisation by steric hindrance	129
	a. Pigment / binder interactions	129
	b. Influence of the solvent	133
	c. Theories of colloidal stability by steric hindrance	136
4.2.3.3	Electrostatic stabilisation. DLVO theory and zeta potential	142
4.3	Stabilisation problems with pigmented systems after dispersion	147
4.3.1	Flocculation	147
4.3.1.1	Fundamental aspects	147
4.3.1.2	Testing and measuring flocculation behaviour	149
4.3.1.3	Kinetic approach to flocculation	151
4.3.1.4	Coflocculation	153
4.3.1.5	Prevention of flocculation	153
4.3.2	Flooding and floating	154
4.3.2.1	Discussion and theoretical explanation	154
4.3.2.2	Testing separation phenomena. Spray-pouring-test and rub-out-test	158
4.3.2.3	Methods for overcoming flooding and floating	159
4.3.3	Shock effects and seeding	162
4.3.3.1	Pigment shock	162
4.3.3.2	Binder shock	162
4.3.3.3	Solvent shock	163
4.3.3.4	Seeding	164
5.	The Dispersion Process: Methods and Mathematical Models for Assessing the Degree of Dispersion	166
5.1	Introduction	166
5.2	Direct methods	166
5.2.1	Fineness-of-grind and dispersion curve	166
5.2.2	Examination with the optical microscope	170

5.3	Indirect methods	170
5.3.1	Tinting strength development	170
5.3.2	Assessment of the state of dispersion from gloss development	177
5.3.3	Increase in lightness flop	179
5.4	Concluding remarks	181
6.	The Dispersion Process: Mill Base Optimisation	182
6.1	General considerations	182
6.2	Description of the dispersion process using a probability function	185
6.2.1	Theoretical principles	185
6.2.2	Practical conclusions from the probability relationship for the dispersion process	188
6.3	Dispersibility of pigments	189
6.3.1	Critical approach to the definition of pigment dispersibility according to DIN 55 943	189
6.3.2	Testing and stating the dispersibility as specified in ISO 8780/8781	189
6.3.3	Assessment of the dispersibility by means of a half-life value	191
6.3.4	A pragmatic definition for pigment dispersibility	192
	Problem 5	194
6.4	Methods for mill base optimisation	199
6.4.1	The Daniel flow-point procedure	199
6.4.2	The Guggenheim factor	201
6.4.3	Efficiency of the dispersion process: New criterion for optimising mill bases	202
6.4.4	Optimisation of several factors by means of an experimental design according to Plackett and Burman	207
6.4.5	Optimisation of the cost of the dispersion process by controlling energy input	210
	Appendix	214
	List of physical symbols and constants used	214
	References	218
	Name Index	227
	Subject Index	230
