

CONTENTS

<i>Foreword to the English edition</i>	vii
<i>Contents</i>	ix
<i>Nomenclature</i>	xiii
<i>Introduction</i>	1
<i>Chapter I. Convex sets and hyperplanes in vector spaces</i>	7
1. Bases. Subspaces. Convex sets	
1.1. Hamel bases	7
1.2. Direct sums and quotients	14
1.3. Affine manifolds and convex sets	21
1.4. Real subspaces. Internal points	30
2. Linear and sublinear functionals	
2.1. Linear functionals	34
2.2. Convex functionals	40
3. Separation of convex sets by hyperplanes	
3.1. Geometric interpretation of the Hahn–Banach theorem	49
3.2. Separation theorems	53
<i>Chapter II. Normed spaces</i>	55
1. Geometric properties of normed spaces	
1.1. Definitions	55
1.2. Finite-dimensional spaces	64
1.3. Quotient and product spaces	72
2. Continuous linear functionals in normed spaces	
2.1. Bounded linear functionals	78
2.2. Extensions of continuous linear functionals. Dual spaces	81
2.3. Separation of convex sets by closed hyperplanes	90
2.4. Theorem of Banach–Steinhaus	91
3. Hilbert spaces	
3.1. Scalar product and Hermitian forms	95

3.2. Geometry of Hilbert spaces	106
3.3. Orthogonal systems	113
3.4. Linear functionals in Hilbert spaces	118
4. Topological vector spaces. Weak topologies	
4.1. Definitions	120
4.2. The dual space of a locally convex topological vector space	129
4.3. Weak, projective and inductive topologies	131
4.4. Extremal points	135
 <i>Chapter III. Ordered vector spaces</i>	 139
1. Extension of positive functionals	
1.1. Compatible orders and cones	139
1.2. Positive functionals	142
1.3. Decomposition theorems	147
1.4. Application to the moment problem	153
2. Invariant extensions	
2.1. Invariant functionals	161
2.2. Application to invariant integration	168
3. Functionals and seminorms in vector lattices	
3.1. Vector lattices	173
3.2. Seminorms in vector lattices	177
3.3. Complete vector lattices and Borel subspaces	181
3.4. The Hahn–Banach minimal extensions	187
3.5. Positive functionals in Archimedean spaces	190
4. Complete ideals and spectral resolution	
4.1. Decomposition theorem	195
4.2. Spectral resolution	201
4.3. The vector lattice of real measures	208
 <i>Chapter IV. Integration theory</i>	 219
1. Extension of integrals and elementary measures	
1.1. Introduction	219
1.2. Minimal extensions in solids of $\mathbf{R}^T$	225
1.3. The integral of Lebesgue–Daniell	231
1.4. Integral associated with a measure	240
1.5. Positive Radon measures in $\mathbf{R}^n$	251
1.6. Generalization to locally compact spaces	255
2. Theorems of Radon–Nikodym, Fubini, and Lebesgue	
2.1. Indefinite integral. Theorem of Radon–Nikodym	261
2.2. Cartesian product of measures	264
2.3. The Lebesgue differentiation theorem	269
2.4. Abstract characterization of the integral $[I, L]$	276

Chapter V. L^p and $C(K)$ spaces. Approximation theory 281

1. L^p spaces
 - 1.1. Basic properties 281
 - 1.2. The space L^∞ 286
 - 1.3. Representation of the dual of L^p 289
 - 1.4. Convolution of functions 296
 - 1.5. L^p as an intermediate space 299
2. Real Radon measures. Characterization of $C(K)$
 - 2.1. Real Radon measures on $\mathbf{R}^n$ 312
 - 2.2. The spaces C^∞ and $\mathcal{D}$ 318
 - 2.3. The space $C(K)$ 324
 - 2.4. Abstract characterization of $C(K)$ 328
3. The best approximation in $C(K)$
 - 3.1. Measures concentrated on finite sets 330
 - 3.2. The best approximation in general spaces 336
 - 3.3. Strictly convex spaces 339
 - 3.4. Basic approximation theorems 341
 - 3.5. T -systems in $C(K)$ 346

Chapter VI. Linear operators in normed spaces 349

1. Linear operators in vector spaces
 - 1.1. Operators of finite rank. Adjoint operators 349
 - 1.2. Canonical and associated mappings. Homomorphisms 352
2. Bounded and compact operators
 - 2.1. Continuous linear operators 356
 - 2.2. Extension of operators 359
 - 2.3. Adjoint operator 360
 - 2.4. Operators on Hilbert spaces 362
 - 2.5. Compact operators 369
 - 2.6. Regular and proper values of an operator 375
3. Operators in L^p spaces
 - 3.1. Interpolation theorems 384
 - 3.2. Pseudo-type $(1, 1)$ in $\mathbf{R}^n$ 391
 - 3.3. Hilbert transforms 398

Chapter VII. Homomorphisms and Fredholm operators 411

1. Homomorphisms and projections
 - 1.1. Open maps 411
 - 1.2. Theorems on homomorphisms 416
 - 1.3. Closed operators 421
 - 1.4. Projections 423
2. Characterization and stability properties of Noether operators
 - 2.1. Equations and operators 431
 - 2.2. Relations between $N(T)$ and $R(T^*)$ 433
 - 2.3. Normally solvable operators 436

2.4. Operators of Noether and Fredholm	437
2.5. Characterization of Fredholm operators	443
2.6. Characterization of Noether operators	445
3. Reduction theory of Noether operators	
3.1. Stable subspaces	450
3.2. Stationary operators	452
3.3. Generalizations of the Jordan decomposition	455
 <i>Chapter VIII. Banach algebras, spectral theorem and Fourier transform</i>	 471
1. Commutative Banach algebras	
1.1. The spectrum of an element	471
1.2. The Gelfand space	476
1.3. Basic theorems	481
1.4. The Gokhberg–Noether algebra	489
2. Spectral theorem	
2.1. Representation of operator algebras	498
2.2. Spectral theorem for individual operators	505
3. The Fourier transform	
3.1. The algebra L^1	515
3.2. The inversion formula and the theorem of Fourier–Plancherel	524
3.3. The Fourier transform in L^2	529
3.4. The algebra of singular integral operators	534
 <i>Appendix</i>	 539
1. Preliminaries	
1.1. Bounded sets in $\mathbf{R}$	539
1.2. General functions	539
1.3. Principles of Zermelo and Zorn	540
1.4. Inequalities of Hölder and Minkowski for sequences	541
2. Metric spaces	
2.1. Definitions and examples	543
2.2. Open and closed sets. Continuous functions	545
2.3. Convergent sequences	549
2.4. Cauchy sequences. Complete spaces	551
3. Topological spaces	
3.1. Definitions	556
3.2. Topology of pointwise convergence of functions	559
3.3. Generalized sequences or nets	561
3.4. Compact sets	562
3.5. Determination of the compact sets in metric spaces	565
3.6. Tychonov's theorem	566
3.7. Continuous numerical functions defined on compact sets	567
