

Contents

Chapter 1 The Euclidean Spaces

1	Sets and the real line	1
*2	A basic property of $\mathbb{R}$	7
3	Euclidean n -space	9
*4	Some light reading concerning $\mathbb{R}^4$	17
5	Spheres and balls	24
*6	The triangle inequality	32
7	The vector algebra of $\mathbb{R}^n$	34
8	Lines	42
9	Hyperplanes	49
10	Pedagogical considerations; slopes	55

Chapter 2 Maps

1	Maps and functions	61
2	More functions and level sets	70
3	The algebra of functions	76
4	The circular functions	81
5	Linear maps	89
6	Limits	94
*7	Proof of the limit theorem	104
8	Continuity; more about limits	107
*9	Graphing rational functions	119

Chapter 3 The Derivative

1	Prelude to differential calculus	122
2	The derivative	133
3	The differential; notations	141
4	Differentiation	149
5	Differentiation of composite functions	157
6	Plane curves and implicit functions	164
7	Summary of applications	171

Chapter 4 Basic Theorems of Analysis

1	Continuous functions on closed intervals	178
2	Maximum and minimum values	186

*3	Compactness and uniform continuity	192
4	Taylor's theorem	196
5	The mean value theorem; antiderivatives	207
*6	A projectile in a vacuum	216
7	Signs of derivatives	223
8	Extremum problems	233

Chapter 5 The Integral

1	The definite integral	239
*2	Theory of the Riemann integral	250
3	The fundamental theorems of calculus	256
4	Leibniz notation for applications; integration	264
5	Areas and mean values	271
6	Volumes of solids of revolution	277
*7	Further applications	286

Chapter 6 Other Elementary Functions

1	Inverse maps; inverse circular functions	296
2	The logarithm function	307
3	The exponential function	314
4	Applications to rate of growth	320
*5	The hyperbolic functions	325
6	Integration by parts	331

Chapter 7 Infinite Series of Constants

1	Sequences	339
2	Series	346
3	Comparison tests	352
*4	Cauchy's convergence criterion	358
5	The integral and ratio tests	361
*6	Limits superior and inferior; the root test	370
7	Alternating series; absolute convergence	375

Chapter 8 Sequences and Series of Functions

1	Basic concepts and power series	383
2	Taylor series and analytic functions	392
*3	Uniform convergence	402
4	Indeterminate forms	410
5	The binomial series; computations	418
6	Series solutions of differential equations	427
7	Undetermined coefficients; the nonhomogeneous case	433
*8	Introduction to Fourier series	438

Chapter 9 Introduction to Differential Calculus of Several Variables

1	Coordinate derivatives	449
2	The differential of a function	459
3	Chain rules	466
4	Implicit functions	477
5	The differential equation $y' = F(x, y)$	490
6	Taylor's theorem for several variables	499
7	Maxima and minima	508

Chapter 10 Matrices and Differential Calculus

1	Matrices and their algebra	518
2	Systems of linear equations.	525
*3	Invertible matrices	535
4	Matrices and linear maps	542
5	Differentials and derivatives	552
*6	A careful definition of differentiability	561
7	Directional derivatives	565
8	Scalar product of vectors in $\mathbb{R}^n$	571
9	Gradients; mean value theorem	580

Appendices

1	Brief summary of algebra and geometry assumed	A-1
2	Tables of functions	A-7
3	A brief table of integrals	A-10
4	Answers to odd-numbered exercises	A-19
