Contents

1 **Introduction** 1
1.1 Background of Vehicle–Track Coupled Dynamics 1
1.2 Academic Rationale of Vehicle–Track Coupled Dynamics 4
1.3 The Research Scope of Vehicle–Track Coupled Dynamics 7
1.4 Research Methodology of Vehicle–Track Coupled Dynamics 11
References 14

2 **Vehicle–Track Coupled Dynamics Models** 17
2.1 On Modeling of Vehicle–Track Coupled System 17
2.1.1 Evolution of Wheel–Rail Dynamics Analysis Model 17
2.1.2 Modeling of Track Structure 21
2.1.3 Modeling of Vehicle 26
2.1.4 General Principles for Vehicle–Track Coupled System Modeling 28
2.2 Vehicle–Track Vertically Coupled Dynamics Model 29
2.2.1 Physical Model 30
2.2.2 Equations of Motion 37
2.3 Vehicle–Track Spatially Coupled Dynamics Model 56
2.3.1 Physical Model 56
2.3.2 Equations of Motion 72
2.3.3 Dynamic Wheel–Rail Coupling Model 122
2.4 Train–Track Spatially Coupled Dynamics Model 136
2.4.1 Basic Principle of Train–Track Dynamic Interaction 136
2.4.2 Train–Track Spatially Coupled Dynamics Model 137
References 145

3 Excitation Models of Vehicle–Track Coupled System 151
3.1 Excitation Input Method 151
3.1.1 Fixed-Point Method 152
3.1.2 Moving-Vehicle Method 153
3.1.3 Tracking-Window Method 153
3.2 Impact Excitation Models 156
3.2.1 Impact Model of Wheel Flat 156
3.2.2 Model of Rail Dislocation Joint 161
3.2.3 Model of Dipped Rail Joint 163
3.2.4 Impact Model of Turnout 163
3.2.5 Other Impulsive Excitation Models 166
3.3 Harmonic Excitation Models 167
3.3.1 Displacement Input Model of Harmonic Excitation 168
3.3.2 Input Method of Common Track Irregularities 175
3.3.3 Input Function of Periodic Harmonic Force 177
3.4 Excitation Model of Track Dynamic Stiffness Irregularity 178
3.4.1 Stiffness Irregularity at Track Transition Sections 179
3.4.2 Track Stiffness Irregularity at Turnout Section 181
3.4.3 Modeling of Rail Infrastructure Defects 182
3.5 Excitation Model of Random Track Irregularity 183
3.5.1 Track Irregularity PSDs of United States of America 185
3.5.2 Track Irregularity PSDs of Germany 187
3.5.3 Track Irregularity PSDs of China 188
3.5.4 Comparison of Typical Track Irregularity PSDs 193
3.5.5 Numerical Simulation Method for Random Track Irregularity Time-Domain Samples Transformed from Track Irregularity PSDs 196
References 201

4 Numerical Method and Computer Simulation for Analysis of Vehicle–Track Coupled Dynamics 203
4.1 Time Integration Methods for Solving Large-Scale Dynamic Problems 203
4.2 New Simple Fast Explicit Time Integration Method: Zhai Method 205
4.2.1 Integration Scheme of Zhai Method 205
4.2.2 Stability of Zhai Method 206
4.2.3 Accuracy of Zhai Method 208
4.2.4 Numerical Dissipation and Dispersion 208
4.2.5 Numerical Examples for Verification 211
4.3 Application of Zhai Method to Analysis of Vehicle–Track Coupled Dynamics 214

4.3.1 Numerical Integration Procedure 215
4.3.2 Determination of Time Step of Zhai Method 216
4.4 On Some Key Issues in Solving Process of Vehicle–Track Coupled Dynamics 218
4.4.1 Determination of Calculated Length of Track and Mode Number of Rail 218
4.4.2 Solving Technique for the Train–Track Coupled Dynamics 219
4.5 Computer Simulation of Vehicle–Track Coupled Dynamics 223
4.5.1 Vehicle–Track Vertically Coupled Dynamics Simulation 223
4.5.2 Vehicle–Track Spatially Coupled Dynamics Simulation 225
4.5.3 Train–Track Spatially Coupled Dynamics Simulation 225
References 228

5 Field Test on Vehicle–Track Coupled System Dynamics 231
5.1 Field Test Methods of Vehicle–Track Coupled System Dynamics 231
5.1.1 Field Test Methods of Vehicle Dynamics 232
5.1.2 Field Test Methods of Track Dynamics 233
5.2 Typical Dynamics Tests of Vehicles Running on Tracks 237
5.2.1 Dynamic Test for a Typical High-Speed Train on Slab Track 237
5.2.2 Dynamic Test for a Typical Freight Vehicle on Ballasted Track 243
5.3 Typical Vehicle–Track Dynamic Interaction Tests 246
5.3.1 Wheel–Rail Interaction Test with a High-Speed Train on Qinshen Passenger Dedicated Line 246
5.3.2 Track Dynamics Test with a 10,000-Tonne Heavy-Haul Train on Daqin Line 251
5.3.3 Wheel–Rail Interaction Test on a Small-Radius Curve in Mountain Area Railway 253
References 258

6 Experimental Validation of Vehicle–Track Coupled Dynamics Models 259
6.1 Experimental Validation on the Vehicle–Track Vertically Coupled Dynamics Model 259
6.1.1 Comparison of Vehicle Vibrations Between Theoretical and Measured Results 260
6.1.2 Comparison Between Theoretical and Measured Vibrations of Track Structure 261

6.1.3 Comparison Between Computed and Measured Wheel–Rail Dynamic Forces 264
6.1.4 Conclusions 266
6.2 Experimental Validation of the Vehicle–Track Spatially Coupled Dynamics Model 267
6.2.1 Experimental Validation by Field Test on Beijing–Qinhuangdao Speedup Line 267
6.2.2 Validation by High-Speed Train Running Test on Qinshen Passenger Dedicated Line 271
6.2.3 Validation by Derailment Experiment for Freight Train Running on Straight Line 273
6.2.4 Experimental Validation by Wheel–Rail Dynamic Interaction Test on a Small Radius Curve of Mountain Railway 275
6.2.5 Conclusions 276
6.3 Experimental Validation of the Train–Track Spatially Coupled Dynamics Model 276
6.3.1 Validation by Measured Coupler Longitudinal Forces of a Heavy-Haul Combined Train Under Braking Conditions 277
6.3.2 Validation by Tested Train Dynamic Characteristics Under Electric Braking Conditions 277
6.3.3 Validation by Measured Results of Heavy-Haul Train Curving Performance 281
6.3.4 Conclusions 283
References 283

7 Computational Comparison of Vehicle–Track Coupled Dynamics and Vehicle System Dynamics 285
7.1 Comparison of Computational Results on Vehicle Hunting Stability 285
7.1.1 Numerical Calculation Method of Vehicle Nonlinear Hunting Stability 285
7.1.2 Comparison of Calculated Critical Speeds Between the Coupled Model and the Traditional Model 288
7.1.3 Summary 289
7.2 Comparison of Calculation Results on Vehicle Ride Comfort 290
7.3 Comparison of Calculation Results on Curving Performance 292
7.3.1 Comparison of Vehicle Passing Through a Small Radius Curved Track at Low Speed 292
7.3.2 Comparison of Vehicle Passing Through a Large Radius Curved Track at High Speed 295

7.4 Conclusions 296
References 297

8 Vibration Characteristics of Vehicle–Track Coupled System 299
8.1 Steady-State Response of Vehicle–Track Interaction 299
8.1.1 Steady-State Response Due to Sleeper Span 300
8.1.2 Track Steady-State Response Under Moving Vehicle 301
8.1.3 Steady-State Curving Response 303
8.2 Dynamic Response of Vehicle–Track Interaction Due to Local Geometry Defects 305
8.2.1 Dynamic Response to Vertical Impulsive Defects 305
8.2.2 Dynamic Response to Lateral Impulsive Defects 313
8.2.3 Dynamic Response to Vertical Local Harmonic Geometry Defects 314
8.2.4 Dynamic Response to Lateral Local Harmonic Geometry Defects 318
8.3 Dynamic Response of Vehicle–Track Interaction to Cyclic Geometry Defects 321
8.4 Dynamic Response of Vehicle–Track Interaction Due to Failure of System Component 323
8.4.1 Dynamic Response to Disabled Lateral Dampers on a High-Speed Bogie 323
8.4.2 Dynamic Response to Fracture of Fastener Clips 324
8.4.3 Dynamic Response to Unsupported Sleepers 325
8.5 Dynamic Response of Vehicle–Track Interaction to Random Irregularities 327
8.5.1 Vibration Characteristics of the Car Body 330
8.5.2 Vibration Characteristics of the Bogie Frame 331
8.5.3 Vibration Characteristics of the Wheelset 331
8.5.4 Characteristics of the Wheel–Rail Forces 331
8.5.5 Vibration Characteristics of the Rail 332
8.5.6 Vibration Characteristics of the Track Slab 332
8.6 Dynamic Response Due to Railway Infrastructure Settlement 333
8.6.1 Dynamic Response Due to Differential Subgrade Settlement 333
8.6.2 Dynamic Response Due to Differential Ballast Settlement 341
References 346

9 Principle and Method of Optimal Integrated Design for Dynamic Performances of Vehicle and Track Systems 347
9.1 Principle of Optimal Integrated Design for Dynamic Performances of Vehicle and Track Systems 347
9.2 Method of Optimal Integrated Design for Dynamic Performances of Vehicle and Track Systems 349
9.2.1 Dynamic Design Method for Vehicle System Based on the Optimal Integrated Design Principle 349
9.2.2 Dynamic Design Method for Track System Based on the Optimal Integrated Design Principle 350
9.3 Case Study I: Optimal Design of Suspension Parameters of a Heavy-Haul Locomotive 351
9.3.1 Operation Safety Analysis of HX_D2C Prototype Locomotive Through Small Radius Curves 352
9.3.2 Optimization Scheme to Improve Curve Negotiation Performance of HX_D2C Heavy-Haul Locomotive 353
9.3.3 Application of HX_D2C Heavy-Haul Locomotive After Design Optimization 356
9.4 Case Study II: Design of a Steep Gradient Section of a High-Speed Railway 359
9.4.1 Engineering and Research Background 359
9.4.2 Comparison of High-Speed Running Performance Between Long Tunnel Scheme and Bridge–Tunnel Scheme for Shazai Island 361
9.4.3 Comparison of High-Speed Running Performance Between Long Tunnel Scheme and Bridge–Tunnel Scheme for Haiou Island 363
9.4.4 Comparison and Selection Between Shazai Island Scheme with Long Tunnel and Haiou Island with Long Tunnel 364
9.4.5 Project Implementation and Operation Practice 365
References 366

10 Practical Applications of the Theory of Vehicle–Track Coupled Dynamics in Engineering 367
10.1 Redesign of Dynamic Performance of a Speedup Locomotive 367
10.1.1 Engineering Background 367
10.1.2 Simulation on Abnormal Lateral Vibration of SS_{7E} Locomotive Prototype 368
10.1.3 Technical Proposal for Improving the Lateral Vibration Performance of SS_{7E} Locomotive 370
10.1.4 Practical Performance and Application Status of the Improved SS_{7E} Speedup Locomotive 373

10.2 Reducing Rail Side Wear on Heavy-Haul Railway Curves 375
10.2.1 The Problem of Rail Wear on Curves of Heavy-Haul Railways 375
10.2.2 Design Methodology of Rail Asymmetric-Grinding Profiles for Curves 378
10.2.3 Numerical Implementation for Design of Rail Asymmetric-Grinding Profiles on a Practical Railway Curves 381
10.2.4 Engineering Practice and Implementation Effect 385
10.3 Safety Control of the Coupler Swing Angle of a Heavy-Haul Long Train 389
10.3.1 Engineering Background 389
10.3.2 Analysis of Wheel–Rail Dynamic Interaction with Large Coupler Free Swing Angle 390
10.3.3 Effect of Coupler Free Swing Angle on Heavy-Haul Locomotive Running Safety and Its Safety Design 392
10.4 Application and Practice for Design of Fuzhou–Xiamen Shared High-Speed Passenger and Freight Railway 394
10.4.1 Engineering and Research Background 394
10.4.2 Effect of Key Parameters of Horizontal Curve on Dynamic Performance of High- and Low-Speed Trains 396
10.4.3 Optimal Integrated Design of Horizontal and Vertical Profiles for the Shared Passenger and Freight Railway 398
10.4.4 Dynamic Effects of High- and Low-Speed Trains on Track Structures 400
10.4.5 Technical Measures for Mitigating Dynamic Effects of Freight Train on Shared Passenger and Freight Railway Track 403
10.4.6 Project Implementation and Practical Operation Effect 405
