Preface	xi
---------	----

Acknowledgements	xiii
------------------	------

I BASIC TOPICS	1
-----------------------	----------

1 What is superconductivity? A brief overview	3
--	----------

1.1	Some introductory, historical remarks	3
1.2	Resistivity	6
1.3	The Meissner effect: perfect diamagnetism	10
1.4	Type I and type II superconductors	13
1.5	Vortex lines and flux lines	17
1.6	Thermodynamics of the superconducting state	18
1.7	Demagnetization factors and screening	23

2 Superconducting materials	27
------------------------------------	-----------

2.1	Introductory remarks	27
2.2	Low- T_c superconductors	27
2.2.1	Superconducting elements	27
2.2.2	Binary alloys and stoichiometric compounds	29
2.3	Organic superconductors	31
2.3.1	Polymer and stacked molecular type	31
2.3.2	Fullerene superconductors	34
2.4	Chevrel phase materials	35
2.5	Oxide superconductors before the cuprates	35
2.6	High- T_c cuprate superconductors	37
2.6.1	The discovery of cuprate superconductors	37
2.6.2	Composition and structure	40
2.6.3	Making high T_c materials	41
2.6.4	Phase diagrams and doping	42
2.6.5	Some remarks on the original idea which led to the discovery of cuprate superconductors	47
2.6.6	Thermal fluctuations of the superconducting condensate. A preliminary discussion	48

2.7	Heavy fermion superconductors	52
2.8	MgB ₂ superconductor	53
2.9	Summarizing remarks	55
3	Fermi-liquids and attractive interactions	57
3.1	Introduction	57
3.2	The non-interacting electron gas	59
3.3	Interacting electrons, quasiparticles and Fermi-liquids	61
3.4	Instability due to attractive interactions	66
3.4.1	Two electrons with attractive interaction	66
3.4.2	Phonon-mediated attractive interactions	71
3.4.3	Reduction of the effective Hamiltonian	75
4	The superconducting state – an electronic condensate	79
4.1	BCS theory: a magnetic analogue	79
4.2	Derivation of the BCS gap equation	81
4.3	Transition temperature T_c and the energy gap Δ	87
4.4	Generalized gap equation, s-wave and d-wave gaps	89
4.5	Quasi-particle tunnelling and the gap	94
4.5.1	Introductory remarks	94
4.5.2	The tunnelling principle	95
4.5.3	Single-particle NIN tunnelling	97
4.5.4	NIS quasiparticle tunnelling	99
4.5.5	SIS quasiparticle tunnelling	102
4.6	BCS coherence factors versus quasiparticle-effects: ultrasound and NMR	103
4.6.1	Introductory remarks	103
4.6.2	Transition rates in ultrasound propagation and NMR	104
4.6.3	Longitudinal ultrasonic attenuation	105
4.6.4	Transverse ultrasound	108
4.6.5	Nuclear magnetic resonance relaxation below T_c	113
4.7	The Ginzburg–Landau theory	115
4.7.1	Some remarks on Landau theory	115
4.7.2	Ginzburg–Landau theory for superconductors	117
4.7.3	Flux quantization	121
5	Weak Links and Josephson Effects	123
5.1	Weak links, pair tunnelling, and Josephson effects	123
5.1.1	Introductory remarks	123
5.1.2	DC Josephson effect: the Feynman approach	125
5.2	AC Josephson effect	128
5.2.1	Alternative derivation of the AC Josephson effect	129
5.3	Josephson current in a magnetic field	131

5.4	The SQUID principle	134
5.5	The Ferrell–Prange equation	136
5.6	The critical field H_{c1} of a Josephson junction	138
5.7	Josephson vortex dynamics	139
5.8	Josephson plasma in cuprate high- T_c superconductors	140
6	London Approximation to Ginzburg–Landau Theory (ψ constant)	141
6.1	The London equation and the penetration depth λ_L	141
6.1.1	Early electrodynamics and the London hypothesis	141
6.1.2	Derivation of the London equation from the free energy	146
6.2	The energy of a single flux line	148
6.2.1	Energy of a flux line: alternative derivation. An exercise	151
6.3	Interacting flux lines: the energy of an arbitrary flux line lattice	154
6.4	Self energy of a single straight flux line in the London approximation	160
6.5	Interaction between two parallel flux lines	162
6.6	Interaction between two flux lines at angle α	164
6.7	General flux-line lattice elastic matrix in the London approximation	166
7	Applications of Ginzburg–Landau Theory (ψ spatially varying)	171
7.1	The temperature-dependent order parameter $ \psi(T) $	171
7.2	The coherence length ξ	172
7.2.1	Relations between λ , ξ and H_c	174
7.3	Two types of superconductors	175
7.4	The structure of the vortex core	180
7.5	The length ξ and the upper critical field B_{c2}	182
7.5.1	Isotropic systems	182
7.5.2	B_{c2} , ξ , and λ in anisotropic superconductors	184
7.6	Ginzburg–Landau–Abrikosov (GLA) predictions for B_{c2}/B_{c1}	188
7.7	Surface superconductivity and B_{c3}	190
8	More on the Flux-line System	199
8.1	Elementary pinning forces and simple models	199
8.1.1	The concept of a pinning force	199
8.1.2	Pinning force and flux gradient	200
8.2	Critical state and the Bean model	201

8.3	Flux-line dynamics, thermal effects, depinning, creep and flow	204
8.3.1	TAFF, flow and creep: Definitions	204
8.3.2	Flux flow	205
8.3.3	Thermally activated flux creep: Anderson model	206
8.4	Single particle TAFF	207
8.5	FLL elasticity and pinning	208
8.5.1	Collective effects	208
8.5.2	Collective creep: inverse power law $U(J)$	212
8.5.3	Logarithmic $U(J)$	213
8.5.4	The vortex solid–liquid transition	215
8.5.5	Lindemann criterion and melting of a clean flux-line system	218
8.5.6	Modelling non-linear vortex diffusion	224
8.6	Flux-line entry at B_{c1} : thermodynamic and geometric restrictions	228
8.6.1	The critical field B_{c1}	228
8.6.2	The Bean–Livingston barrier	229
8.6.3	Geometric barriers	232
8.7	Critical current issues	233
8.7.1	Critical current in the Meissner state	233
8.7.2	Depairing critical current	234
8.7.3	Reduction of J_c at grain boundaries	235
8.7.4	Relaxation of magnetic moment and the irreversibility line	236
8.7.5	How can J_c be increased?	242
II	ADVANCED TOPICS	247
9	Two-dimensional superconductivity. Vortex-pair unbinding	249
9.1	Introduction	249
9.2	Ginzburg–Landau description	250
9.3	Critical fluctuations in two-dimensional superfluids	251
9.4	Vortex–antivortex pairs	255
9.5	Mapping to the 2D Coulomb gas	257
9.6	Vortex-pair unbinding and Kosterlitz–Thouless transition	264
9.7	Jump in superfluid density	271
10	Dual description of the superconducting phase transition	279
10.1	Introduction	279
10.2	Lattice formulation of the Ginzburg–Landau theory	282
10.2.1	Lattice Ginzburg–Landau model in a frozen gauge approximation	284

10.3	Preliminary results	286
10.4	Vortex-loops as topological defects of the order parameter	289
10.5	Superconductor–superfluid duality in $d = 3$	295
10.6	Zero-field vortex-loop blowout	298
10.6.1	Definitions	299
10.7	Fractal dimension of a vortex-loop tangle	306
10.8	Type I versus type II, briefly revisited	309

III SELECTED APPLICATIONS 315

11 Small scale applications 317

11.1	More JJ-junction and SQUID basics	318
11.1.1	Introductory remarks	318
11.1.2	RSJ – the resistively shunted Josephson junction	318
11.1.3	Further modelling of the Josephson junction	322
11.1.4	The autonomous DC SQUID	323
11.1.5	Simplified model of the DC SQUID	325
11.2	SQUID applications	329
11.2.1	Biomagnetism: neuromagnetic applications	329
11.3	Superconducting electrodynamics in the two-fluid model	333
11.3.1	Frequency dependent conductivity in the two fluid model	333
11.3.2	Surface impedance and AC loss	336
11.3.3	Surface resistance measurement	339
11.4	High-frequency radio technology	341
11.4.1	Microstrip filters and delay lines	341
11.4.2	Superconducting high-frequency devices	345

12 Superconducting Wire and Cable Technology 349

12.1	Low- T_c wire and cable	349
12.1.1	Introductory remarks	349
12.1.2	General design considerations	350
12.1.3	Basic superconductor properties	350
12.1.4	Design of technical superconductors	353
12.1.5	Stabilization	355
12.1.6	AC losses	358
12.1.7	Mechanical characteristics	359
12.1.8	Fabrication technology	359
12.2	High- T_c wire and cable	362
12.2.1	High- T_c wire and tape	362
12.2.2	Full-scale high- T_c cable	363
12.2.3	HTS induction heater	364
12.3	Magnet technology	366

IV TOPICAL CONTRIBUTIONS **369**

13 Topical Contributions **371**

13.1	Spin-Triplet superconductivity, by Y. Maeno	371
13.2	π -SQUIDS – realization and properties, by J. Mannhart	374
13.3	Doppler effect and the thermal Hall conductivity of quasiparticles in <i>d</i> -wave superconductors, by N.P. Ong	376
13.4	Nanometer-sized defects responsible for strong flux pinning in NEG123 superconductor at 77 K, by M. Muralidhar and M. Murakami	378
13.5	Hybrid Magnets, by H. Schneider-Muntau	380
13.6	Magneto-Optical Imaging of Vortex Matter, by T.H. Johansen	385
13.7	Vortices seen by scanning tunneling spectroscopy, by Oystein Fischer	388
13.8	Resistivity in Vortex State in High- T_c Superconductors, by K. Kadowaki	392
13.9	Coated conductors: a developing application of high temperature superconductivity, by James R. Thompson, and David K. Christen	395
	References Chapter 13	397

V HISTORICAL NOTES **399**

14 Historical notes on superconductivity: the Nobel laureates **401**

	Heike Kamerlingh Onnes	401
	John Bardeen	402
	Leon N. Cooper	403
	J. Robert Schrieffer	404
	Ivar Giaever	405
	Brian D. Josephson	407
	J. George Bednorz	408
	K. Alex Müller	410
	Alexei A. Abrikosov	411
	Vitaly L. Ginzburg	413
	Pierre-Gilles de Gennes	414
	Philip W. Anderson	415
