|-------------------------------------------------------------------|----|
| PART 1 – BACKGROUND .....                                         | 7  |
| 1. Introduction.....                                              | 9  |
| 1.1. Design modelling from mathematical point of view .....       | 9  |
| 1.2. Basic definitions .....                                      | 12 |
| 1.2.1. Design variables .....                                     | 12 |
| 1.2.2. Objective function .....                                   | 12 |
| 1.2.3. Constraints .....                                          | 12 |
| 1.3. Literature review.....                                       | 13 |
| 1.3.1. Optimization with respect to maximum stress.....           | 14 |
| 1.3.2. Optimization with fracture and fatigue constraints.....    | 25 |
| 1.4. The aim and scope of this monograph .....                    | 35 |
| 2. Designing against failure .....                                | 39 |
| 2.1. Stress minimization.....                                     | 41 |
| 2.2. Stress intensity factor minimization .....                   | 46 |
| 2.3. Fatigue life maximization .....                              | 48 |
| 2.4. Bound formulation.....                                       | 51 |
| 2.5. Multicriteria (vector objective function) problems.....      | 52 |
| 2.6. Structural optimization .....                                | 53 |
| 2.7. Shape optimization .....                                     | 53 |
| 2.8. Related problems .....                                       | 56 |
| 2.8.1. Optimization against buckling.....                         | 56 |
| 2.8.2. Contact optimization problem .....                         | 58 |
| 2.8.3. Dynamic response optimization problem.....                 | 58 |
| 2.8.4. Rigidity maximization .....                                | 59 |
| 2.8.5. Min-max approach to shakedown.....                         | 59 |
| 2.8.6. Optimization of plastic structures.....                    | 59 |
| 2.8.7. Robust design optimization .....                           | 61 |
| 2.8.8. Optimal design of composite structures .....               | 61 |
| 3. Numerical models of analysis of stress and strain fields ..... | 65 |
| 3.1. Stress analysis methods .....                                | 65 |
| 3.2. Numerical model of Finite Element Method .....               | 66 |
| 3.2.1. Finite element analysis of shells of revolution .....      | 67 |
| 3.3. Numerical model of Boundary Element Method.....              | 69 |

2024 DCz. 081

|                                                                                                   |     |
|---------------------------------------------------------------------------------------------------|-----|
| 3.3.1. Stress analysis with Fictitious Load Method .....                                          | 70  |
| 3.3.2. Direct Boundary Element Method.....                                                        | 71  |
| 3.4. Stress intensity factor computations .....                                                   | 74  |
| 3.5. Fatigue analysis .....                                                                       | 76  |
| 3.5.1. Fatigue life prediction.....                                                               | 78  |
| 3.5.2. Approximate elasto-plastic stress-strains relations.....                                   | 78  |
| 3.5.3. Notch correction rules for uniaxial loading .....                                          | 79  |
| 3.5.3.1. Neuber rule.....                                                                         | 80  |
| 3.5.3.2. Molski-Glinka model .....                                                                | 81  |
| 3.5.4. Notch correction rules for multiaxial loading.....                                         | 83  |
| 3.5.5. Incremental notch correction rules for multiaxial loading.....                             | 83  |
| 3.5.5.1. Generalized Neuber rule.....                                                             | 84  |
| 3.5.5.2. Equivalent strain energy density relations.....                                          | 86  |
| 3.5.6. Other notch corrections models for proportional and<br>nonproportional cyclic loading..... | 88  |
| 3.6. Cyclic plasticity model .....                                                                | 89  |
| 3.6.1. Discrete multisurface hardening model formulation .....                                    | 89  |
| 3.6.2. Continuous description of field of hardening module .....                                  | 92  |
| 3.7. Critical plane approach and selected fatigue damage criteria.....                            | 95  |
| 4. Geometric modelling .....                                                                      | 99  |
| 4.1. Shape definition of notch using CAGD tools .....                                             | 99  |
| 4.1.1. Bezier's formulation .....                                                                 | 103 |
| 4.1.1.1. Standard Bezier curves.....                                                              | 103 |
| 4.1.1.2. Modified Bezier curves .....                                                             | 104 |
| 4.1.1.3. Rational Bezier curves.....                                                              | 106 |
| 4.2.1. Superellipses.....                                                                         | 106 |
| 5. Sensitivity analysis.....                                                                      | 109 |
| 5.1. Direct sensitivity analysis with FLM method.....                                             | 111 |
| 5.1.1. Design sensitivity of boundary stresses .....                                              | 111 |
| 5.1.2. Numerical examples .....                                                                   | 112 |
| 5.1.2.1. Infinite plate with circular hole under uniaxial<br>tension in infinity .....            | 112 |
| 5.1.2.2. Infinite plate with elliptical hole under uniaxial<br>tension in infinity .....          | 114 |
| 5.1.2.3. Pressurised cylinder problem .....                                                       | 116 |
| 5.1.2.4. Finite plate with elliptic hole in square plate under<br>biaxial tension loading .....   | 117 |
| 5.2. DSA analysis with FEM method for axisymmetric shells.....                                    | 120 |
| 5.3. Finite difference method with modification technique.....                                    | 121 |

|                                                               |     |
|---------------------------------------------------------------|-----|
| 6. Optimization procedure .....                               | 125 |
| 6.1. Approximation concepts for structural optimization ..... | 126 |
| 6.2. Description of SLP code .....                            | 128 |

## PART 2 – APPLICATIONS..... 131

|                                                                                                     |     |
|-----------------------------------------------------------------------------------------------------|-----|
| 7. Minimum stress design of machine elements under static loading.....                              | 133 |
| 7.1. Shape synthesis of single notches.....                                                         | 133 |
| 7.1.1. The classical fillet problem.....                                                            | 133 |
| 7.1.2. Optimum shape of hole in infinite plate under uniaxial<br>tension .....                      | 135 |
| 7.1.3. Optimum shape of hole in infinite plate under biaxial<br>tension .....                       | 139 |
| 7.1.4. Optimum shape of ovaloid hole in infinite plate .....                                        | 141 |
| 7.1.5. Optimum shape of cut-out in finite tensioned strip .....                                     | 144 |
| 7.2. Optimal defence notch systems (interacting notches).....                                       | 148 |
| 7.2.1. Optimum shape of internal notches (holes) in infinite plate<br>under uniaxial tension .....  | 151 |
| 7.2.2. Sizing optimization of interacting holes in finite strip under<br>uniaxial tension .....     | 152 |
| 7.2.3. Optimum shape of defence (auxiliary) holes in finite strip<br>under uniaxial tension .....   | 153 |
| 7.2.4. Optimum shape of external notches (cut-outs) in finite<br>tensioned strip .....              | 154 |
| 7.3. "Worst case" of stress concentration – antyoptimization .....                                  | 156 |
| 7.3.1. "Worst case" formulation .....                                                               | 157 |
| 7.3.2. Boundary representation.....                                                                 | 158 |
| 7.3.3. Numerical examples .....                                                                     | 158 |
| 7.3.4. Concluding remarks.....                                                                      | 159 |
| 7.4. Photoelastic verification of a shape optimised notches in 2-D<br>machine components .....      | 160 |
| 7.4.1. Optimum shape of oblong hole in infinite plate .....                                         | 160 |
| 7.4.2. Optimum shape of internal notches (holes) in finite strip<br>under uniaxial tension .....    | 161 |
| 7.4.3. Optimum shape of external notches (cut-outs) in finite strip<br>under uniaxial tension ..... | 163 |
| 8. Shape optimization to minimum stress concentration in axisymmetric<br>shells .....               | 165 |

|                                                                                                                                               |     |
|-----------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 8.1. Axisymmetric thin shells .....                                                                                                           | 166 |
| 8.1.1. Shape definition of midsurface of thin axisymmetric shells..                                                                           | 167 |
| 8.1.2. Optimum shape of UFO tank with internal static pressure....                                                                            | 168 |
| 8.1.3. Optimum shape of UFO tank with internal static pressure<br>with small cylindrical part.....                                            | 172 |
| 8.1.4. Optimum shape of cylindrical pressure vessel end closure ...                                                                           | 174 |
| 8.2. Axisymmetric thick shells (hollow bodies of revolution).....                                                                             | 178 |
| 8.2.1 Optimal shape of fillet .....                                                                                                           | 179 |
| 8.2.2 Optimum shape of groove .....                                                                                                           | 181 |
| 9. Topology and shape optimization of structural components with<br>fracture constraints.....                                                 | 183 |
| 9.1. SIF minimization for single crack in plate under uniaxial<br>tension by system of defence holes .....                                    | 184 |
| 9.2. SIF minimization of single crack in plate under uniaxial<br>tension by system of circular defence holes .....                            | 186 |
| 9.3. SIF minimization using defence hole systems for stopping growth<br>of single crack in uniaxial tensioned plate in presence of stiffeners | 187 |
| 9.4. Shape optimization of stop holes .....                                                                                                   | 188 |
| 10. Optimal shape design of notched components for low cycle fatigue<br>constraints .....                                                     | 193 |
| 10.1. Maximization of the fatigue life of plate with central hole.....                                                                        | 193 |
| 10.2. Optimum shape of internal notches (holes) in finite plate (strip)<br>under uniaxial tension.....                                        | 195 |
| 10.3. Concept of stop holes conditioned by cycling loading .....                                                                              | 195 |
| 10.4. Shape optimization of the groove in axially loaded<br>axisymmetric bar .....                                                            | 198 |
| 11. Conclusions.....                                                                                                                          | 201 |
| References.....                                                                                                                               | 203 |
| Streszczenie.....                                                                                                                             | 229 |
| Abstract.....                                                                                                                                 | 235 |
| Notation.....                                                                                                                                 | 237 |
